

# **VESPA**

(Virtual European Solar & Planetary Access)

## **involvement with planetary surfaces**

---

Stéphane Erard  
Chiara Marmo  
Angelo Pio Rossi  
Mikhail Minin  
Pierre Fernique  
Batiste Rousseau  
Baptiste Cecconi  
Pierre Le Sidaner

## VESPA: Status

- VESPA : an action in Europlanet 2020-RI (2015-2020)  
Research Infrastructure programme  
big effort integrated at EU level, with many external collaborations  
(ESA, NASA, JAXA, IPDA, IVOA, IAU)
- Europlanet 2020 ended Aug 2019
- Follow-on in Europlanet 2024, started Feb 2020 (4 years)  
Coupled with other actions, in particular planetary cartography WP
- VESPA portal in French context: certified INSU service, ANO5  
**VESPA portal**    <http://vespa.obspm.fr>

## VESPA: What has been provided to the community?

1- A user interface to search data based on science parameters:

**VESPA portal**    <http://vespa.obspm.fr>

2- A set of data services provided by VESPA participants and other teams:

**55 data services open, 15 more in development**

**Includes ESA's PSA (10 million files!)**

**New or updated infrastructures: SSHADE, PVOL, AMDA**

3- Connection with powerful display and analysis tools:

**Tools from astronomy (VO, with planetary science updates)**

**+ Earth observation (GIS) + space archives (PDS)**

**=> Open Science system, providing FAIR access to the data**

**This data system is available for science teams to access and *to distribute* data, as per the Virtual Observatory paradigm**

## VESPA: objectives

### Make research data easily accessible:

- search Planetary Science databases based on physical / observational parameters (making sense for researchers)

New DM : EPNCORE, used with TAP protocol

- search many databases at once

All services queried together in default mode => data discovery

- straightforward interface to access VO tools for Planetary Science

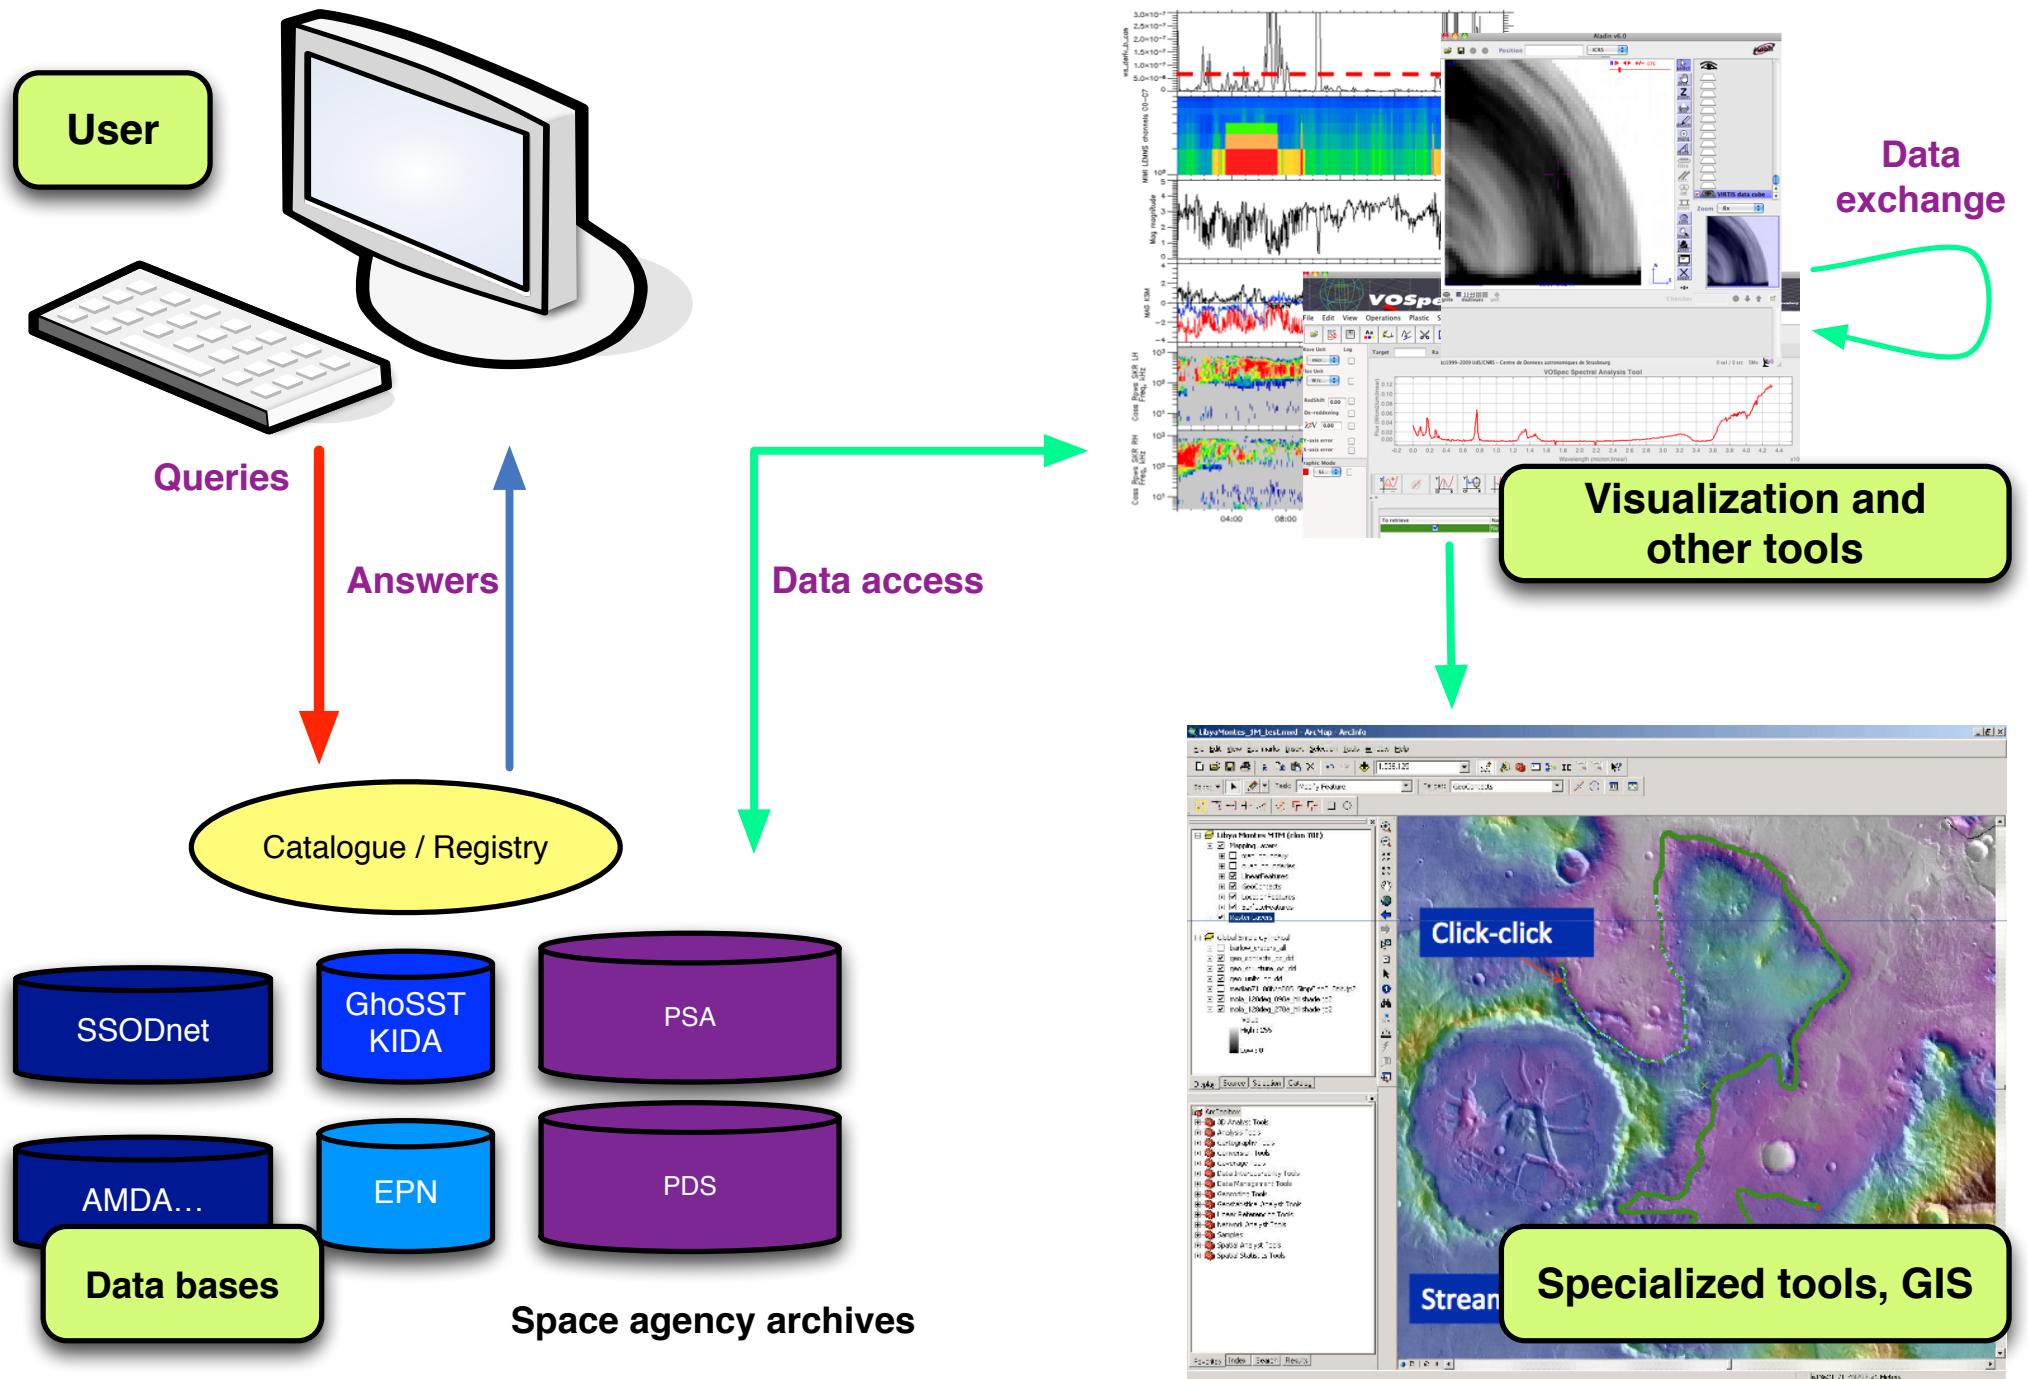

SAMP on portal & new tools; OK as long as format permits

- contributive system open to additions

Stress on derived data, related to publications

=> publication of EPN-TAP standard and docs, tutorials

# User's experience

## VESPA: scope

VESPA encompasses many aspects of Solar System studies:

- surfaces
- atmospheres
- magnetospheres / radio observations
- small bodies / satellites / rings / dynamics
- solar physics / planetary plasmas
- exoplanets
- solid spectroscopy / experimental reference data

- **Today: discussion restrained to surfaces only**

VO context is handled in IVOA (IG for Solar System, 2017+),  
& IPDA for space data

Main contributors in IVOA include VESPA / Europlanet

## Contexte de la discussion

- Actions CNES sur surfaces / petits corps / atmosphères / accès OV en soutien à la communauté

- Today: discussion restrained to surfaces only

=> commencé comme une confrontation entre solutions OV et GIS  
- *pas pertinent, ce sont des solutions complémentaires*

- Rapport INSU 2019:

... jusqu'à l'arrivée de JUICE dans le système jovien (2030). La poursuite du développement de l'observatoire virtuel de planétologie VESPA est nécessaire.

[A propos de JUNO] Un soutien au SNO5 « VESPA » et à la proposition de labellisation du SNO5 « MASER » est souhaité.

- Rapport PNP 2018:

[A propos des surfaces planétaires] La prochaine décennie verra un plus faible nombre de missions spatiales européennes être lancées ou en opération que durant les deux dernières décennies. Il en résultera une *baisse significative du volume de nouvelles données qui devra être compensé par un investissement plus fort dans les demandes d'observation sol et dans les outils d'Observatoire Virtuel* pour augmenter le retour scientifiques des missions précédentes.

## Planetary surfaces

- Encompass all solid surfaces (planets, satellites, asteroids, comets) as long as they are resolved
- This community is (roughly) split in two parts for historical reasons:
  - physicists / astronomers - including spectroscopy (& space operations?)
  - geologists / geomorphologists - plus possibly geochemistry, etc
- These 2 communities use different tools / formats & have different needs
  - More astro than geol in France? - No reason to favor one against the other
  - Conversely, need to make all results accessible to all researchers
- In addition, space data are available in a different, funny format — PDS
  - + in situ (landers /rover) data to be handled

## Planetary surfaces - needs

- **physicists / astronomers**

### Needs:

- powerful search functions in datasets (to find obs configs of interest)
- including own dataset (to manage an experiment in operation)
- quick visu in context (on maps / images)
- other dim are important: time, spectral (incl. lab data), alti (surf-atm interactions)

### Formats:

- PDS (mostly PDS3) for space data; fits for ground-based/orbital ones; others
- VO context is recent: fits, VOTable, HiPS, MOC, STC-S, VOevents... + TAP, CS, SIA... queries

- **geologists / geomorphologists**

### Needs:

- powerful and accurate 2D visu, mapping, many layers (including vectors)

### Formats:

- GDAL lib available. geotiff, geojson, WMS / WCS / WMTS queries (OGC world)

## Planetary surfaces - needs

- **physicists / astronomers**

### Objectives:

- Adapt existing VO standards and tools for Planetary Science (2D and spectral)
- support funny formats (PDS, possibly netcdf...)

### Difficulties:

- Coordinate systems (here limited body-fixed ones => IAU, but not only)
- New data descriptors, often with no counterpart in astro (reflected light, illumination angles, local time, light travel time...) => UCDs

- **geologists / geomorphologists**

### Objectives:

- Take advantage of (huge) dev for Earth observation, adapt to Planetary Science

### Difficulties:

- Coordinate systems (body-fixed ones)
- Tiling schemes adapted to planets?

# Data services connected via EPN-TAP / field

Open  
Open in test  
In development  
Being studied

## Atmospheres

- Titan profiles - CIRS ([Cassini, LESIA](#))
- *Venus spectroscopy* - [VIRTIS \(VEx, LESIA\)](#)
- Mars Climate Database ([modeling, LMD-LESIA](#))
- Venus profiles - [SPICAV/SOIR \(VEx, IASB-BIRA\)](#)
- Mars profiles - [SPICAM \(MEx, LATMOS\)](#)
- *All MEx derived atmospheric products (via MEx IDS)*
- *Venus cloud products (LATMOS)*

## Small bodies

- [M4ast \(ground based spectroscopy, IMCCE\)](#)
- [1P/Halley spectroscopy - \(IKS / Vega-1, LESIA\)](#)
- [BaseCom - \(Nançay obs, LESIA\)](#)
- TNOs are cool - ([Herchel & Spitzer + compilation, LESIA & LAM & Utinam](#))
- SBNAF - (outcome of the H2020 prog, Konkoly Obs)
- [Cometary lines catalogue \(IAPS\)](#)
- [Vesta & Ceres spectroscopy - VIR/DAWN \(IAPS\)](#)
- \*- [DynAstVO: NEO refined parameters \(IMCCE\)](#)
- [MPCorb: Small bodies orbital cat \(MPC/Heidelberg\)](#)
- [Rosetta ground-based support \(via C. Snodgrass\)](#)
- [67P illumination config \(IRAP\)](#)
- \*- [Meteor\\_showers predictions \(IMCCE\)](#)

## Surfaces

- CRISM WCS service ([MRO, Jacobs U](#))
- Mars craters ([Jacobs U, + update by GEOPS](#))
- \*- USGS planetary maps, WMS ([Jacobs U](#))
- M3 WMS service ([Chandrayaan-1, Jacobs U](#))
- \*- HRSC data, WMS ([MEx, Frei Univ](#))
- OMEGA cubes and maps ([MEx, IAS](#))
- \*- VIMS calibrated/geometry cubes ([Cassini, LPG](#))
- [MarsSI GIS \(Lyon\)](#)

## Solid spectroscopy

- \*- SSHADE: ices & minerals ([IPAG & network](#))
- [Planetary Spectral Library \(DLR\)](#)
- \*- PDS spectral library ([LESIA](#))
- [Berlin Reflectance Spectral Lib \(DLR\)](#)

## Magnetospheres / radio

- \* - APIS ([HST/Cassini, LESIA](#))
- NDA ([Jupiter radio Nançay, LESIA](#))
- AMDA ([CDPP / IRAP](#))
- MAG data ([VEx, IWF Graz](#))
- \* - *MASER & Juno support (LESIA) + associated services*
- [RadioJove \(LESIA & US amateur network\)](#)
- \* - Ililate HF data of Jupiter ([Tohoku Univ, Jap](#))
- [UTR-2 Juno ground support \(Kharkiv\)](#)
- MDISC ([modeling, UCL](#))
- \* - Cluster & Themis data ([IAP, Prague](#))
- Interface with IMPEx models ([IWF Graz](#))
- [Hisaki \(Tohoku Univ., Jap\)](#)
- \* - Transplanet ([CDPP / IRAP](#))
- \* - LOFAR Jupiter ([SRC/PAS, Varsovie](#))

\* New/updated in 2019

## Exoplanets

- Encyclopedia of exoplanets ([compilation, LUTH/LESIA](#))
- [Transit observations \(Bern\)](#)
- Interface with DACE ([Geneva](#))

## Solar

- [HELIOS AR & 1T3 solar features catalogues \(LESIA\)](#)
- \*- Bass2000 ([LESIA](#))
- [Radio Solar db \(Nançay, LESIA\)](#)
- \*- CLIMSO ([Pic du Midi, IRAP](#))
- \*- Ililate AMATERAS ([Tohoku Univ, Jap](#))

## Generic / interdisciplinary

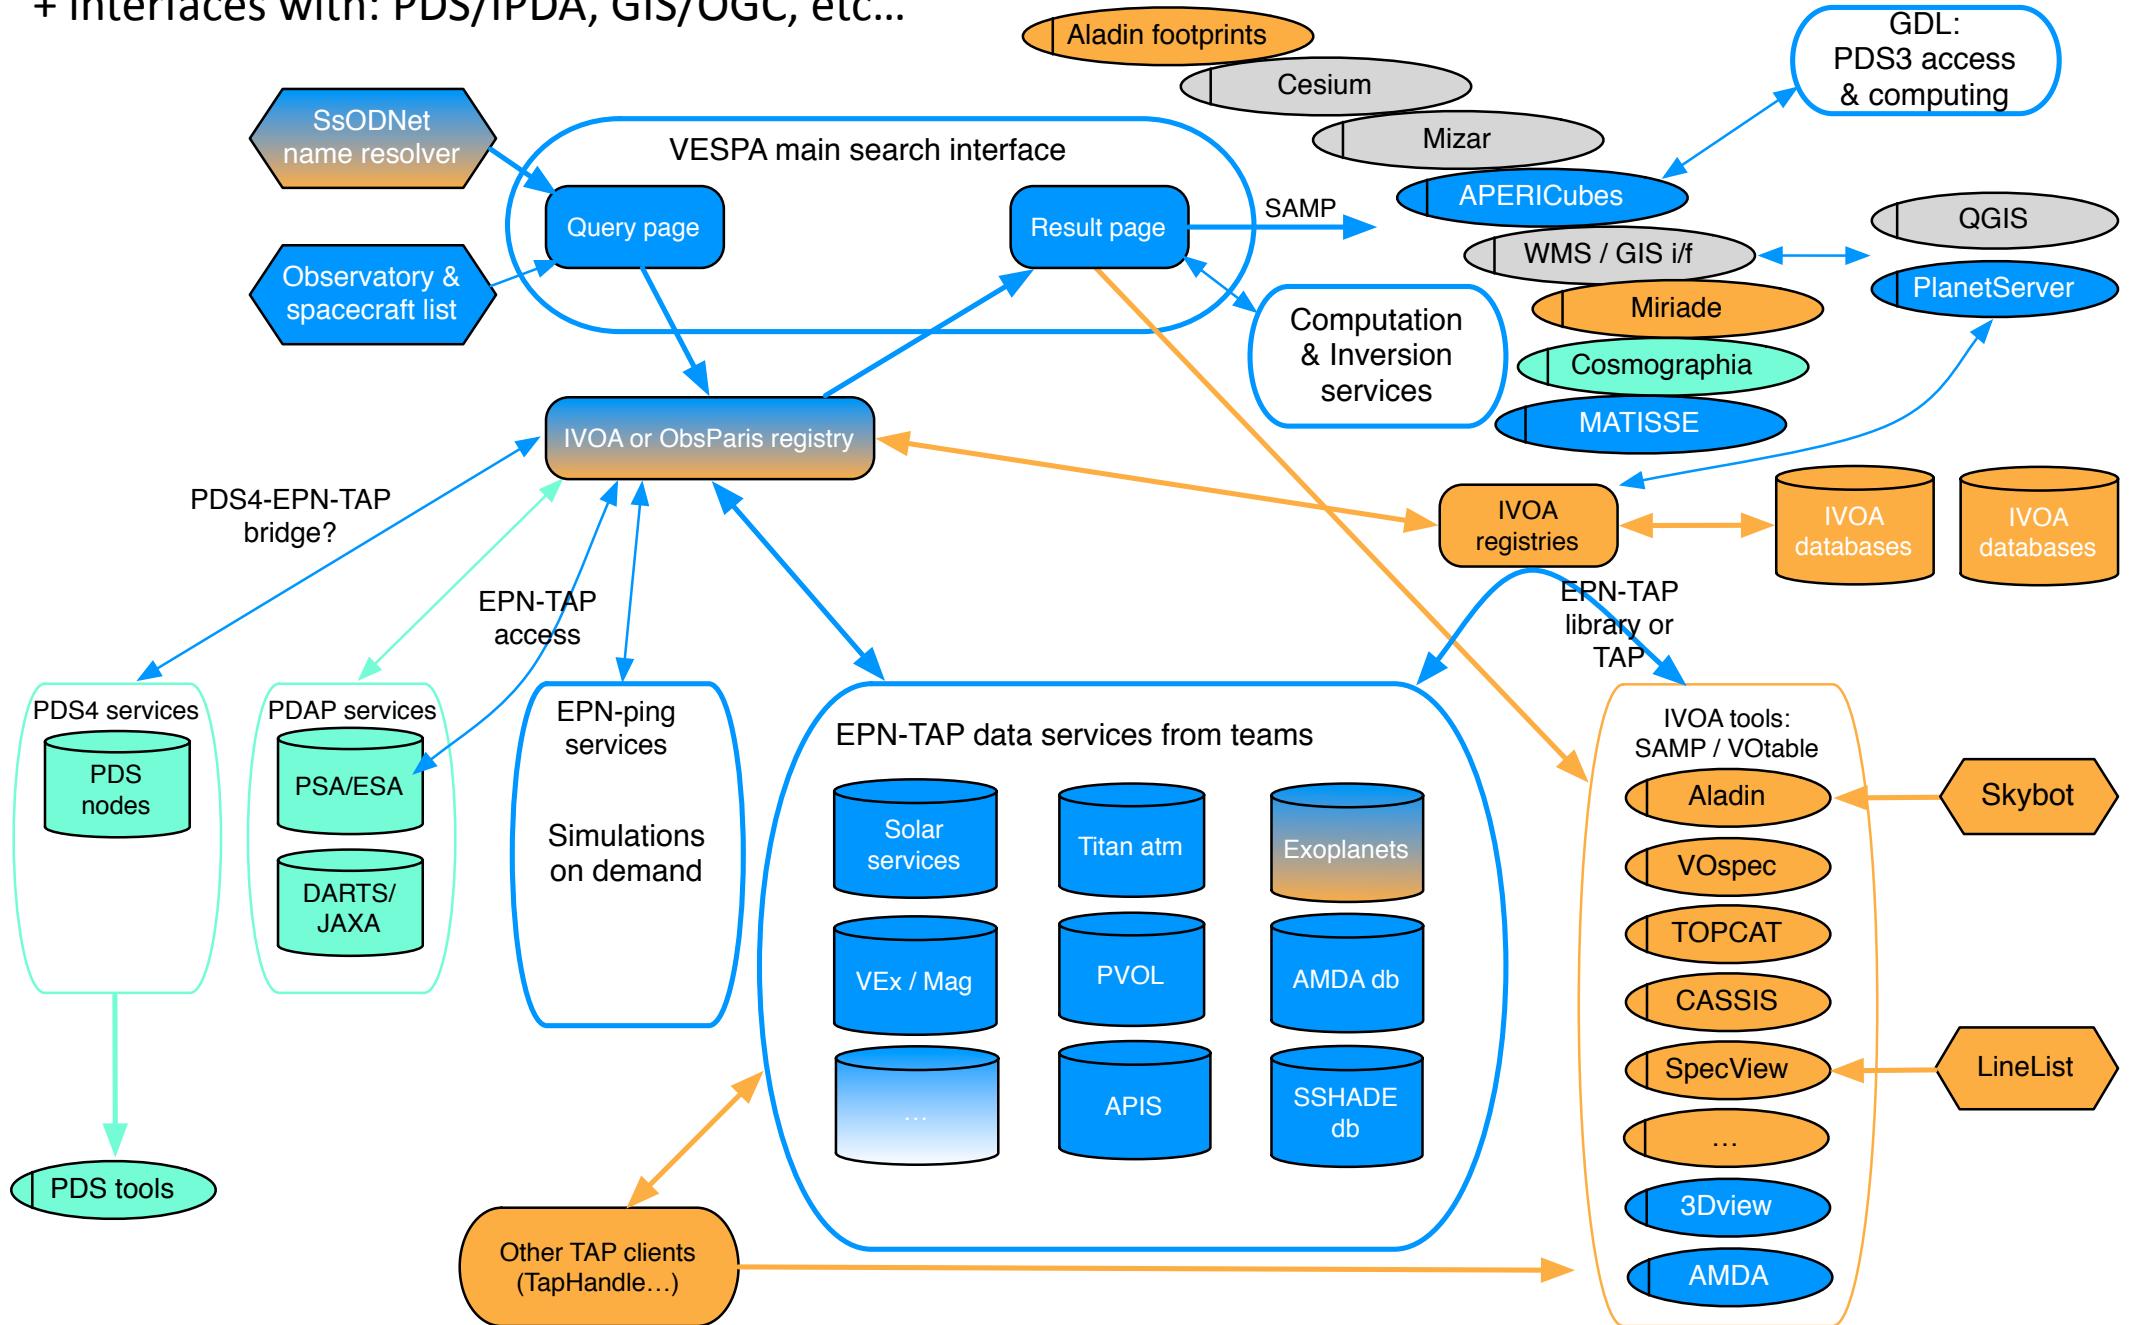

- BDIP ([LESIA](#))
- \*- PVOL ([UPV/EHU & amateur network](#))
- \*- PSA complete archive ([ESA](#))
- \*- HST planetary data ([LESIA, to CADC archive](#))
- Planets/satellites spectra collection ([LESIA](#))
- [DARTS \(JAXA - currently via PDAP\)](#)
- [Planets then satellites characteristics \(LESIA/IMCCE\)](#)
- [Gas absorption cross-sections \(Granada\)](#)
- [Nasa dust catalogue \(IAPS\)](#)
- [Stellar spectra, support for observations & expl. \(LESIA\)](#)
- [Interface with VAMDC \(TBD\)](#)

# A Virtual Observatory in Planetary Science

Built on astronomical VO developments (IVOA)

+ previous European programs: IMPEX, HELIO, VAMDC...

+ interfaces with: PDS/IPDA, GIS/OGC, etc...

## EPN-TAP request:

Typical for surfaces (assuming all data correctly described):

Mars, a given region (~ Tharsis volcanoes) (disk images need to be informed)

Illumination conditions ( $i \leq 20^\circ$  / phase: needs to be informed)

Local time or season, etc (need to be informed)

Results from all services  
=> need to be described at similar level

Footprints can be sent to plotting tools from the portal

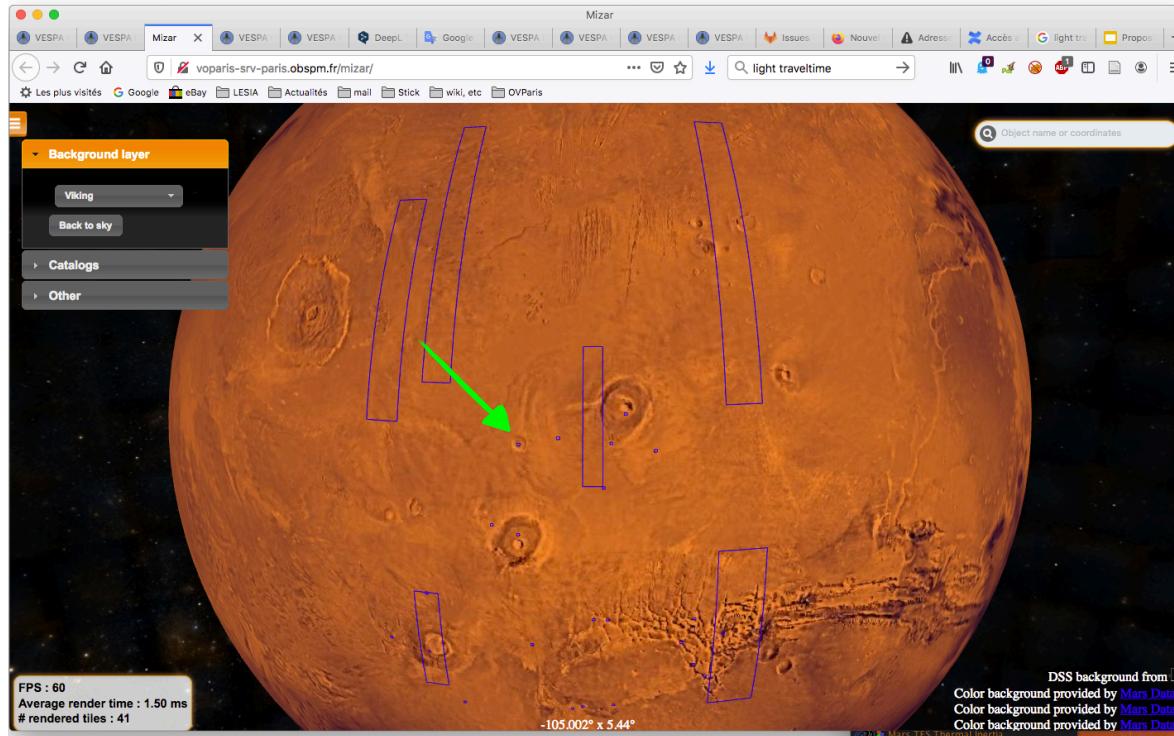

The screenshot shows the VESPA Query Interface. On the left, there's a sidebar with tabs for 'Form' (selected), 'Query', 'EPN-TAP Services', and 'Custom Service'. Under 'Main Parameters', there are fields for 'Target Name' (Mars), 'Target Class', 'Dataproduct Type', 'Instrument Host Name', 'Target Class', 'Dataproduct Type', 'Instrument Host Name', and 'Instrument Name' (TAP query). Below these is a 'Processing level' dropdown. A red bracket on the right groups the 'Instrument Name' field and the 'Processing level' dropdown. The main area is titled 'EPN Resources' and lists several datasets: 'hrsc3nd - HRSC nadir images of Mars' (6 results), 'omega\_cubes - L3 Omega Cubes from PSUP' (70 results), 'PlanetServer\_CRISM - Subset of CRISM/MRO georeferenced cubes' (48 results), 'abs\_cs - Data for numerical modeling of planetary atmospheres' (0 result), 'AMDA - Planetary and heliophysics plasma data at CDPP/AMDA' (0 result), 'APIS - Auroral Planetary Imaging and Spectroscopy' (0 result), 'BASECOM - The Nançay Cometary Database' (0 result), 'bass2000 - Bass2000 solar survey archive' (0 result), and 'BDIP - Base de Données d'Images Planétaires' (0 result). To the right of the results is a 'Plotting tools' section with links to TOPCAT, Aladin, SPLAT, CASSIS, and 3DView. At the bottom, there's a 'Generated WHERE clause of ADQL statement:' and a code block, followed by sections for 'EPN-TAP compilation results' and 'PDAP Resources (by dataset)'. The status bar at the bottom shows search terms like 'Q\_ano5', 'Tout surigner', 'Respecter la casse', 'Mots entiers', and 'Occurrence 1 sur 2'.

# EPN-TAP typical request on surfaces:

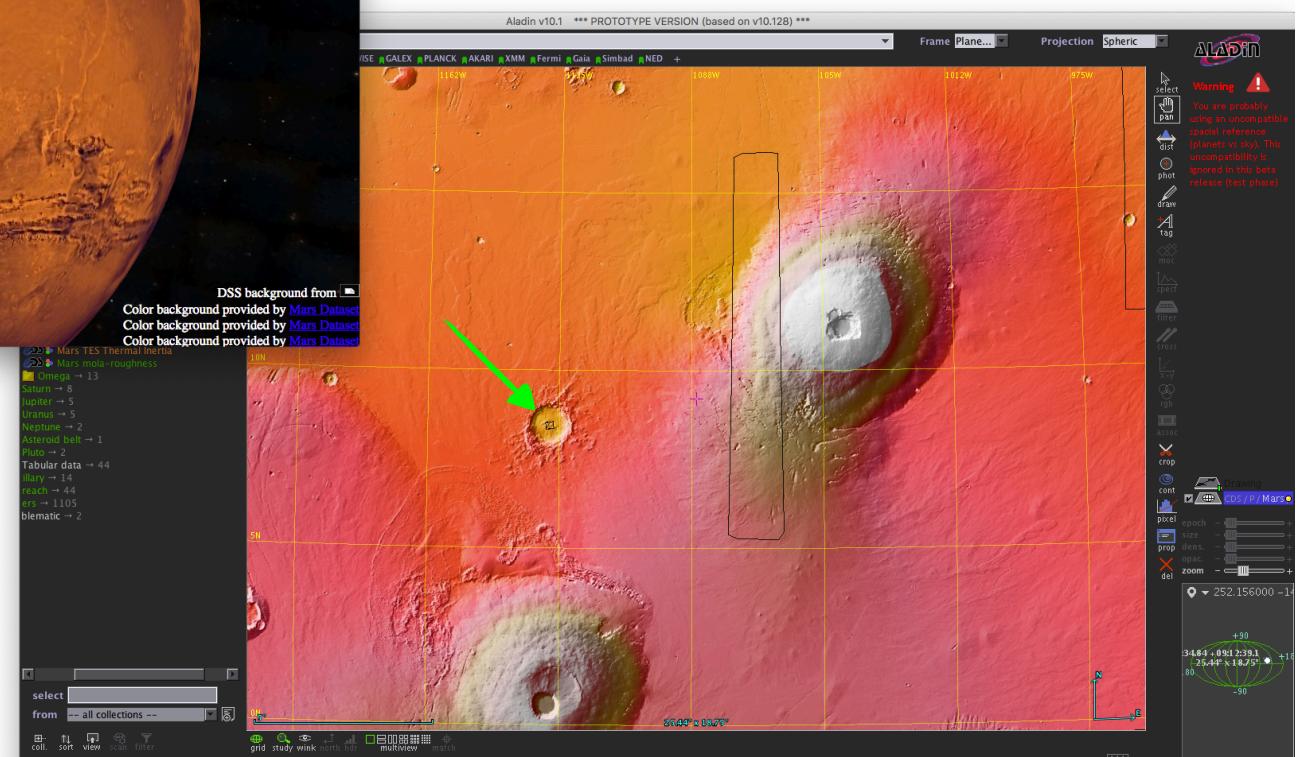

Mars, a given region (~ Tharsis volcanoes => limits in lon/lat)

Illumination conditions ( $i \leq 20^\circ$  / phase: needs to be informed)

Local time or season, etc (needs to be informed)

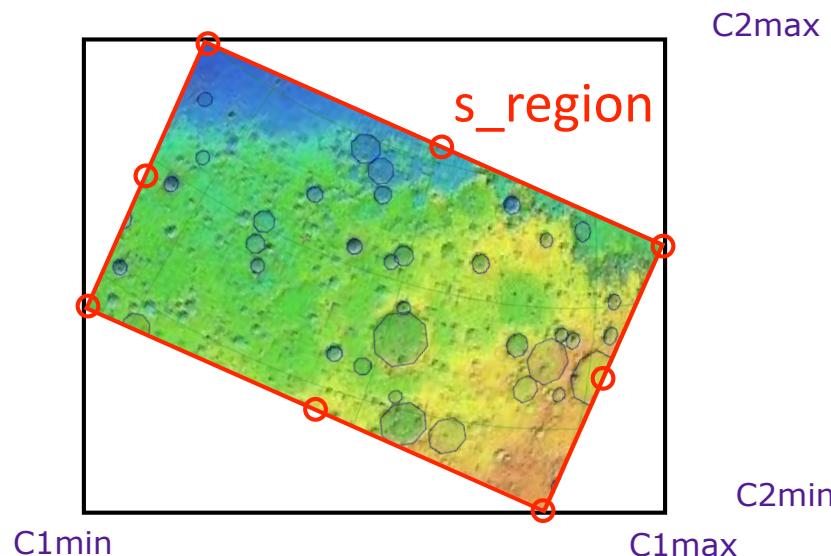

HRSC & CRISM in Mizar (bounding boxes)

HRSC & CRISM in Aladin (STC-S contours)  
- also implemented in TAPHandle with AladinLite

# Using clever footprints

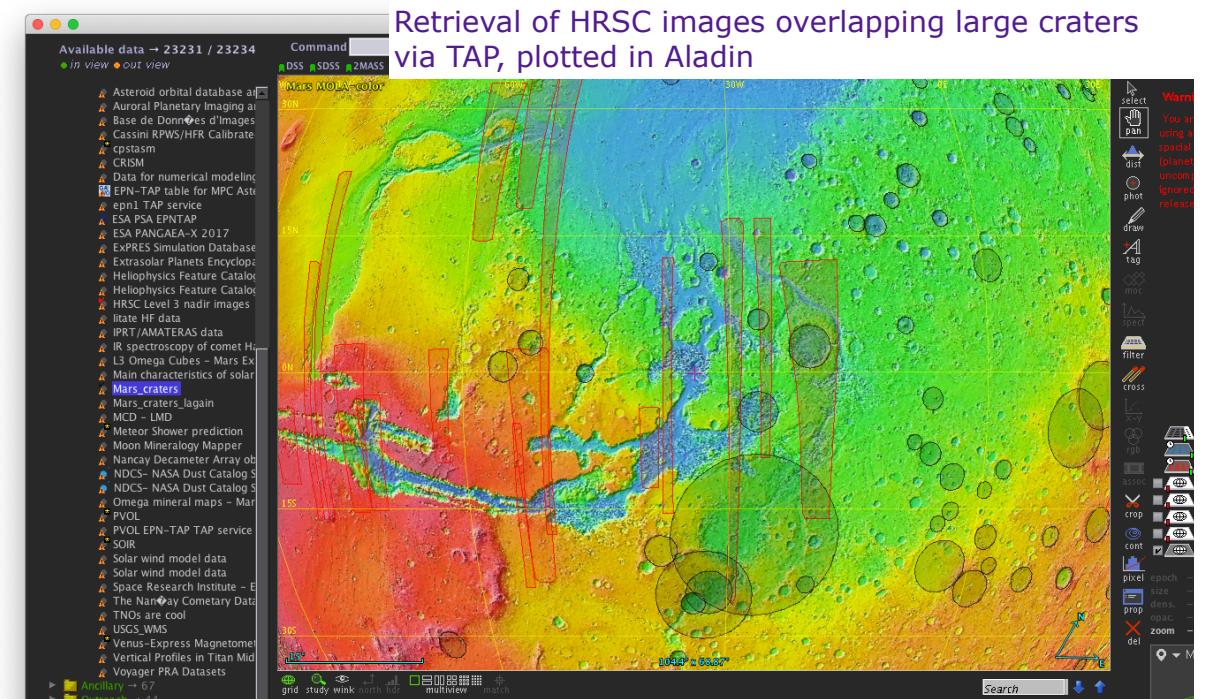

lon/lat min/max coordinates

STC-S allow for very powerful searches on intersections / overlaps via TAP, e.g. images overlapping structures

Open issue with coord system IDs though (~same as geojson)

- **PDS3-like limits (lon/lat bounding box)**  
=> provide very rough estimate of footprint and many false alarms
- **STC-S strings, aka s\_region (sampling the contour)**  
=> provide much more accurate footprints with tunable resolution  
Close equivalent in OGC world: geojson

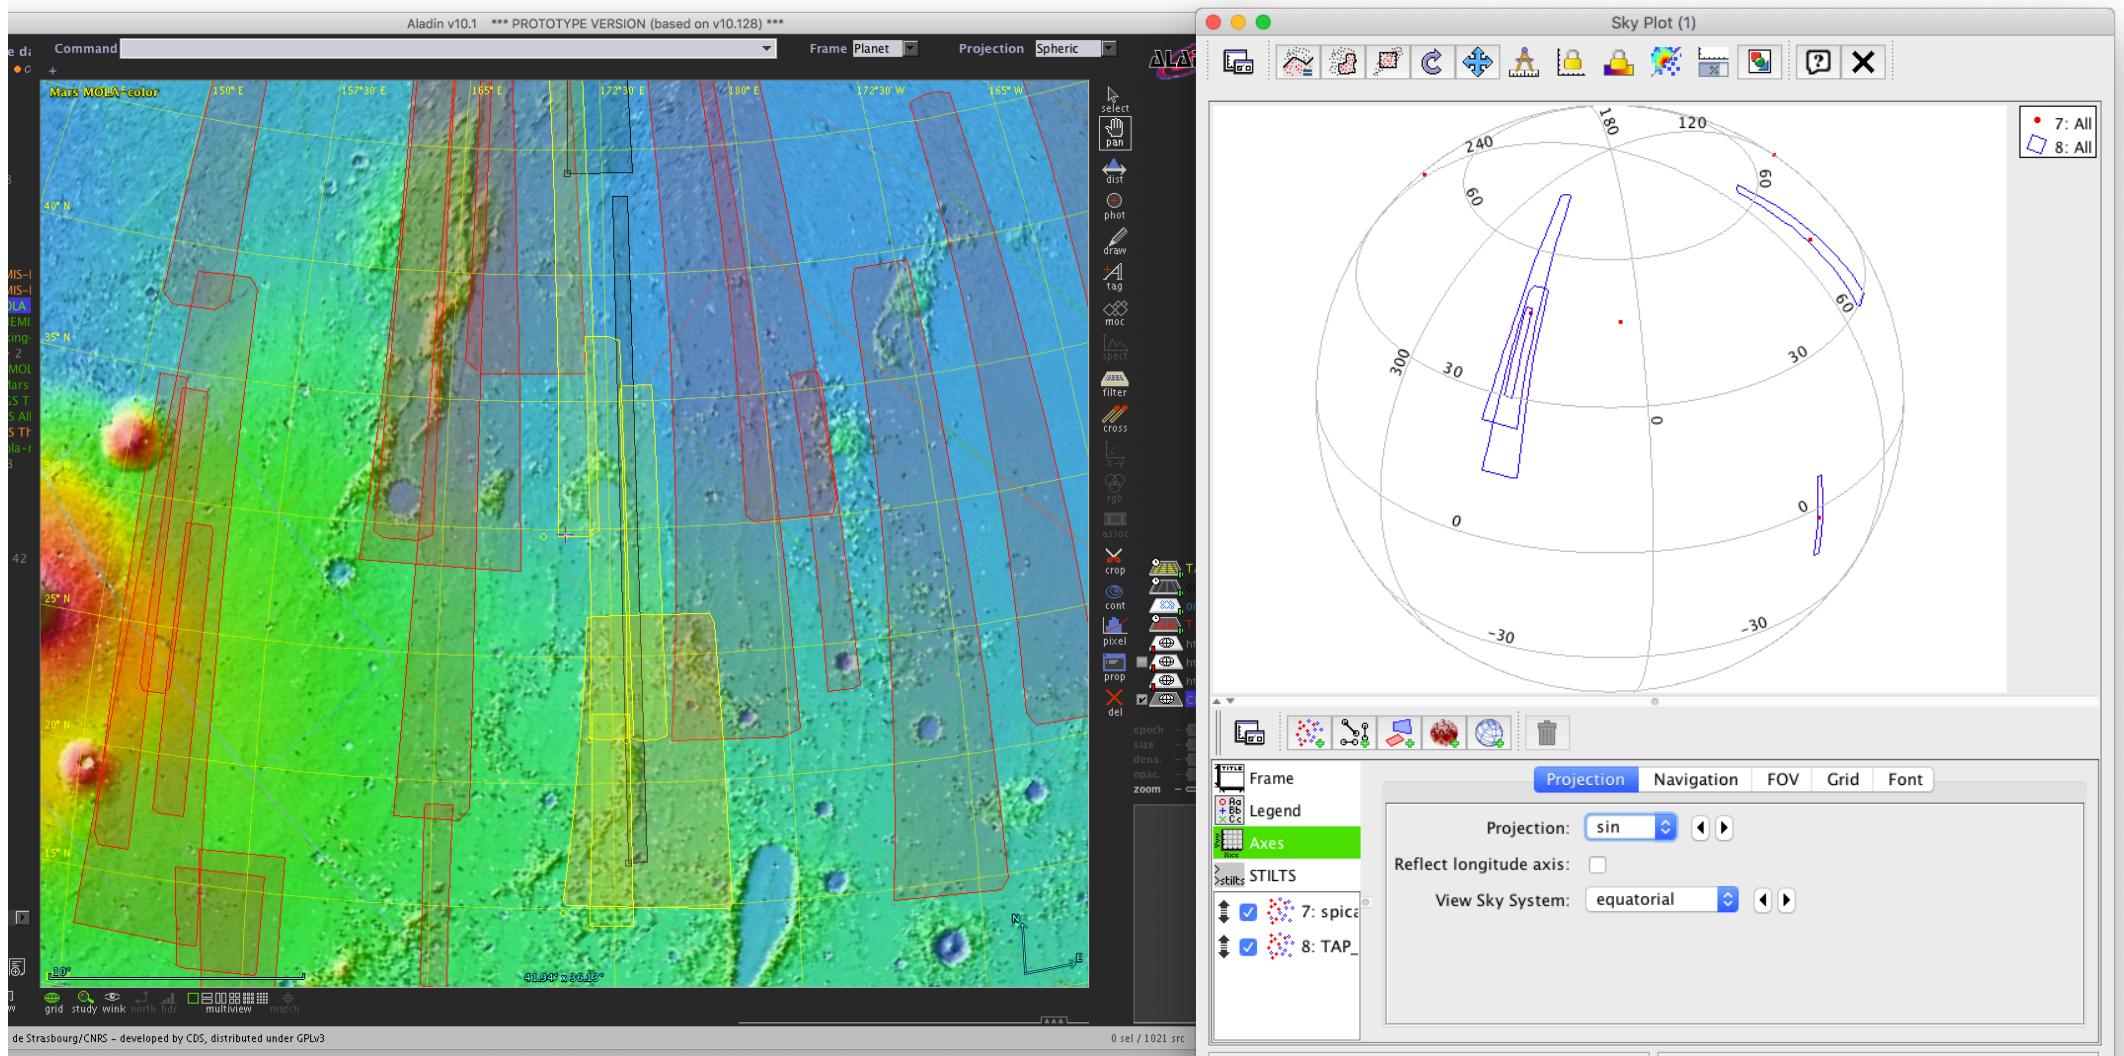

# footprint based searches

2D overlaps based on actual footprints, in TAP

**Typical request:**  
**identify overlapping images / spectral cubes from different datasets  
based on footprints (also works with point features)**

Tutorial: [https://github.com/epn-vespa/tutorials/blob/master/surfaces/HRSC\\_vs\\_OMEGA/HRSC\\_vs\\_OMEGA-tutorial.md](https://github.com/epn-vespa/tutorials/blob/master/surfaces/HRSC_vs_OMEGA/HRSC_vs_OMEGA-tutorial.md)

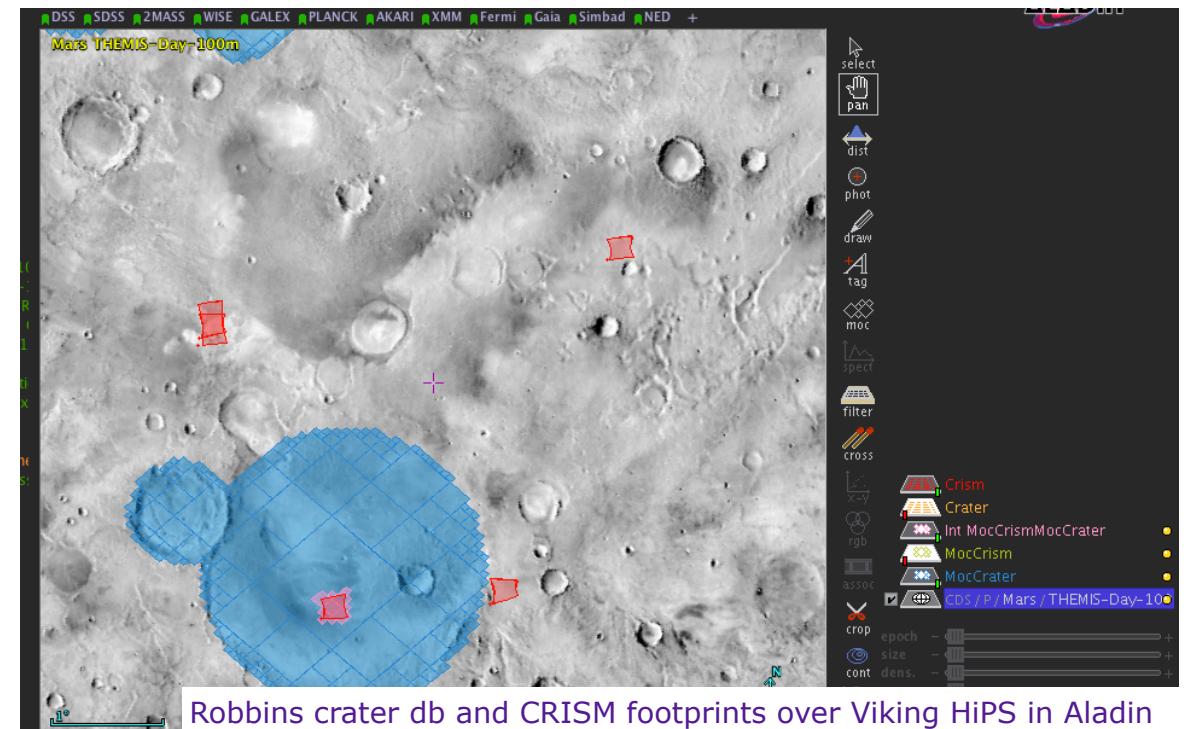

HRSC (red) and selection of OMEGA cubes (black) in Aladin  
Overlapping HRSC images in yellow (Mars-Express observations)

Selected SPICAM profiles (red) and overlapping HRSC images  
(blue) in TOPCAT (Mars-Express observations)

# Using clever footprints, next step

- MOC - Multi Order Coverages  
(healpix-based)

=> Even quicker to compute and use (but difficult to store). Can apply to entire datasets or individual files

- preserves reference to progenitors

- now extended to time coverage

=> potentially extremely powerful to manage an operational dataset & cross-correlate several datasets

See <https://www.youtube.com/watch?v=gnJ5glhRmA>

Application to Saturn ephemerides: [https://wiki.ivoa.net/internal/IVOA/InterOpMay2019TDIG/Aladin\\_time\\_2019 - Fernique.pdf](https://wiki.ivoa.net/internal/IVOA/InterOpMay2019TDIG/Aladin_time_2019 - Fernique.pdf)

Application to VIRTIS/VEx dataset in progress

# Coordinate Systems

## Need to tag spatial data correctly

**Body / frame** (IAU2000, etc) / **properties** (-centric / -graphic) / **etc**

Need for short descriptors / IDs to be used as keyword values

## Several classifications exist:

**IAU WGCRE** (mostly body-fixed)

**NAIF / SPICE** (JPL - usual computation system for space missions)

**STC** (IVOA standard for astronomy, with room for planets)

**Reference publications** for heliophysics / magnetospheres

## VESPA action started in EPN-RI & EPN2020

**Body-fixed frames** (Jacobs Uni / GEOPS / USGS / ObsParis)

**Outer solar system** (JPL / PDS PPI / ObsParis)

To be completed and made consistent

— long-term effort, should involve all the community

CNES is certainly involved in this (same issue for OGC standards)

## Tools connected to / used by VESPA

### - Standard/existing tools associated to VESPA/Europlanet:

**Aladin** (CDS/CNRS), **CASSIS** (IRAP/CNRS)

Both include Planetary Science updates from VESPA

**3Dview** (CNES/IRAP/GFI): plot along s/c trajectories

**MATISSE** (ASI/IAPS): 3D visu for *some* PDS3 data, supports shape models

**TOPCAT** (Univ Bristol): tabular data, including metadata

### - New tools developed in VESPA:

**Planetary Cesium Viewer** (GEOPS/CNRS)

**APERICubes** (*some* PDS spectral cubes, ObsParis)

**QGIS SAMP plug-in & improved fits** (VO-GIS bridge, Jacobs Univ/GEOPS)

**ImageJ SAMP plug-in & improved fits support** (ObsParis, in progress)

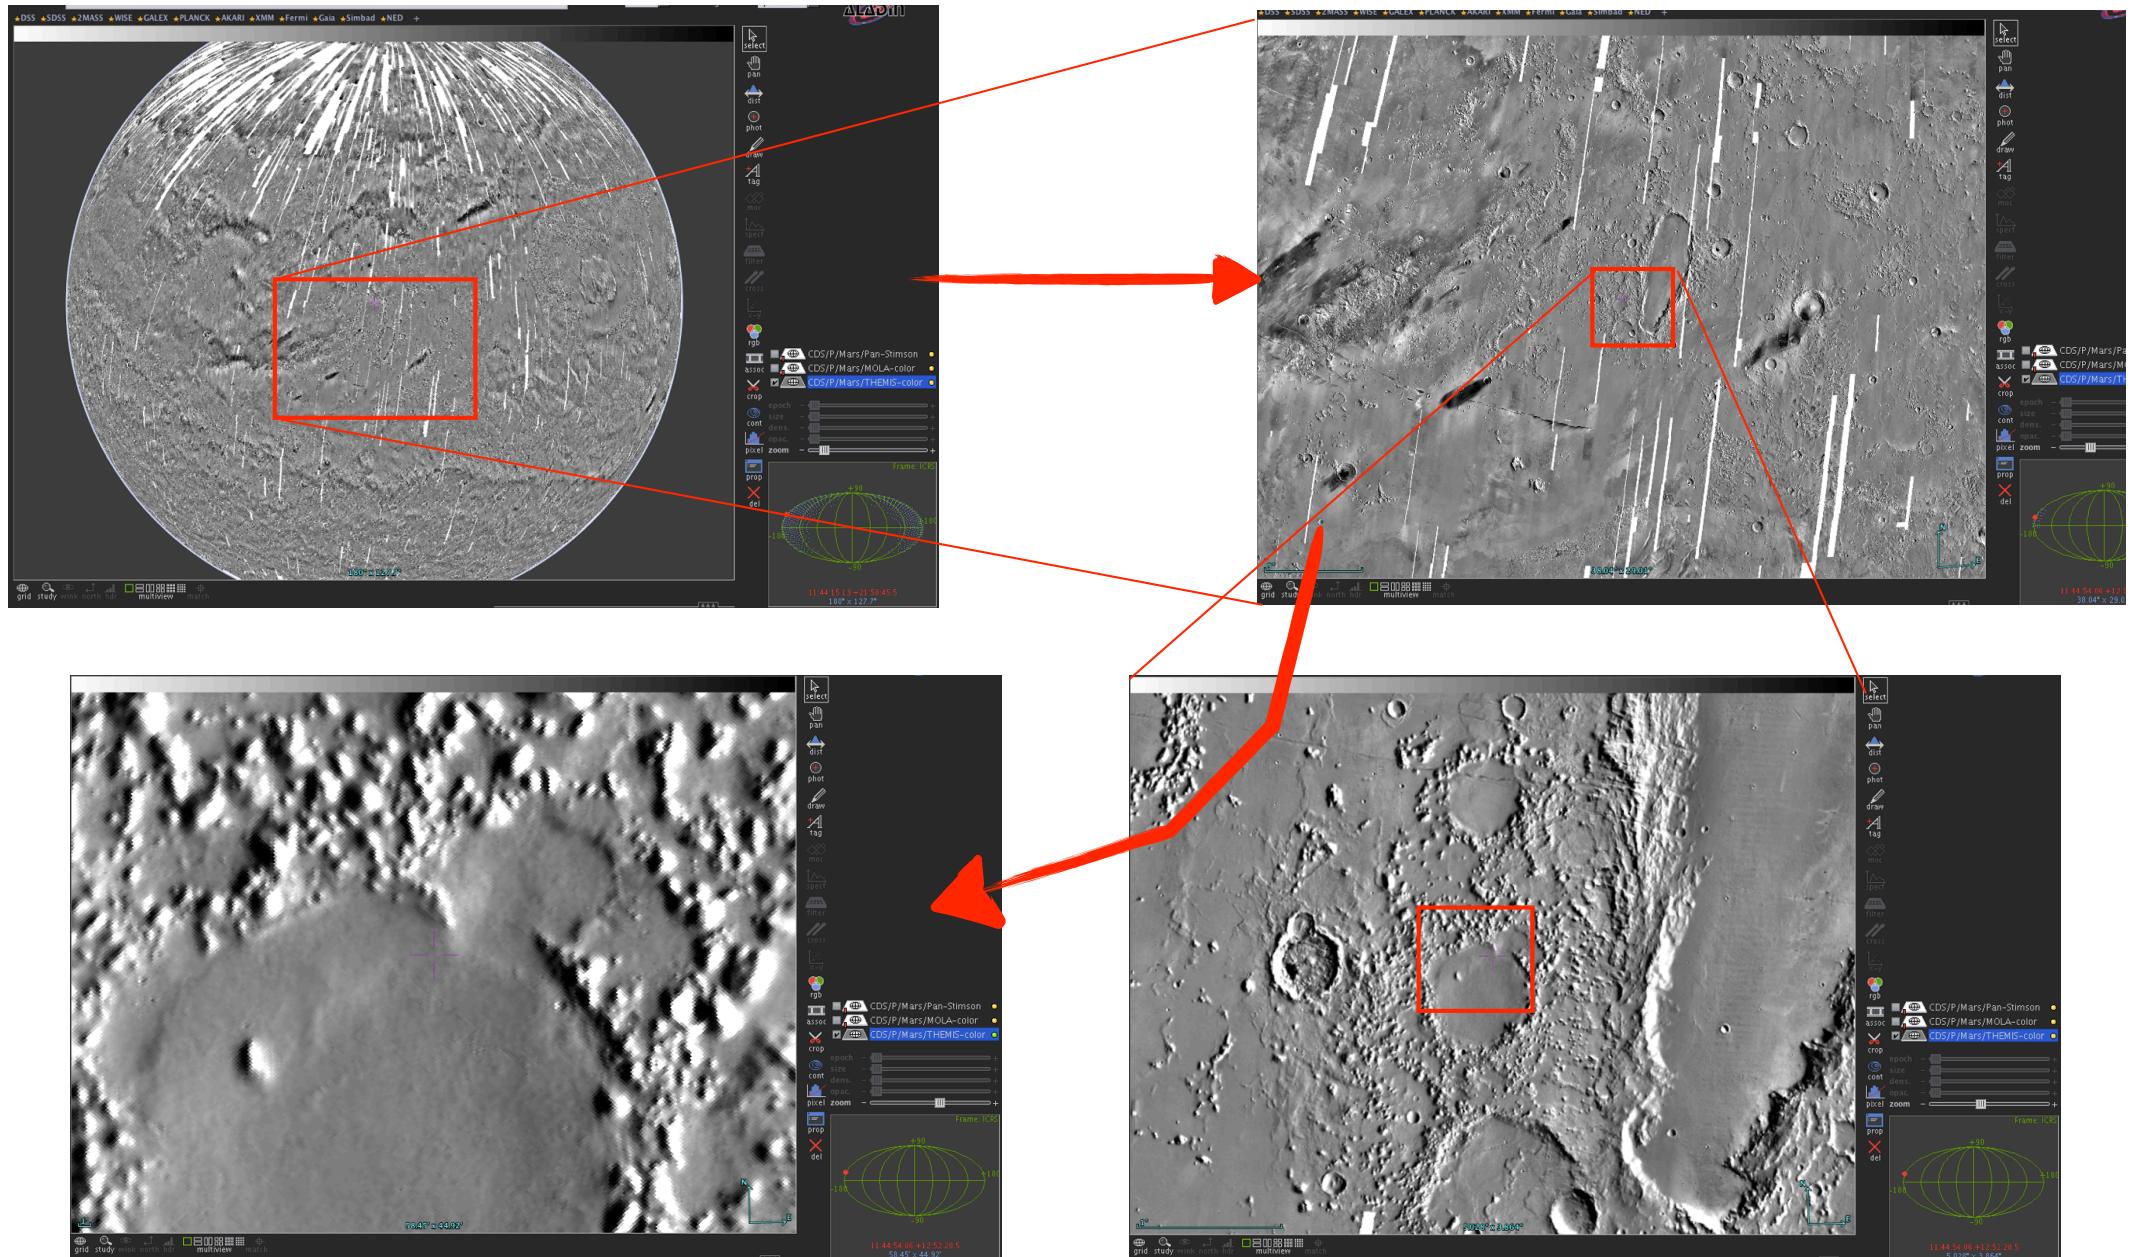

### - Other useful tools in VESPA context:

**SPLAT-VO** (Heidelberg), **Autoplot** (Iowa), **Mizar** (CNES)

+ possibly **DS9** (SAO), **Cosmographia**, **WebGeoCalc** (JPL)

## New VESPA functions

## Multiresolution maps (HiPS) in Aladin (and more)

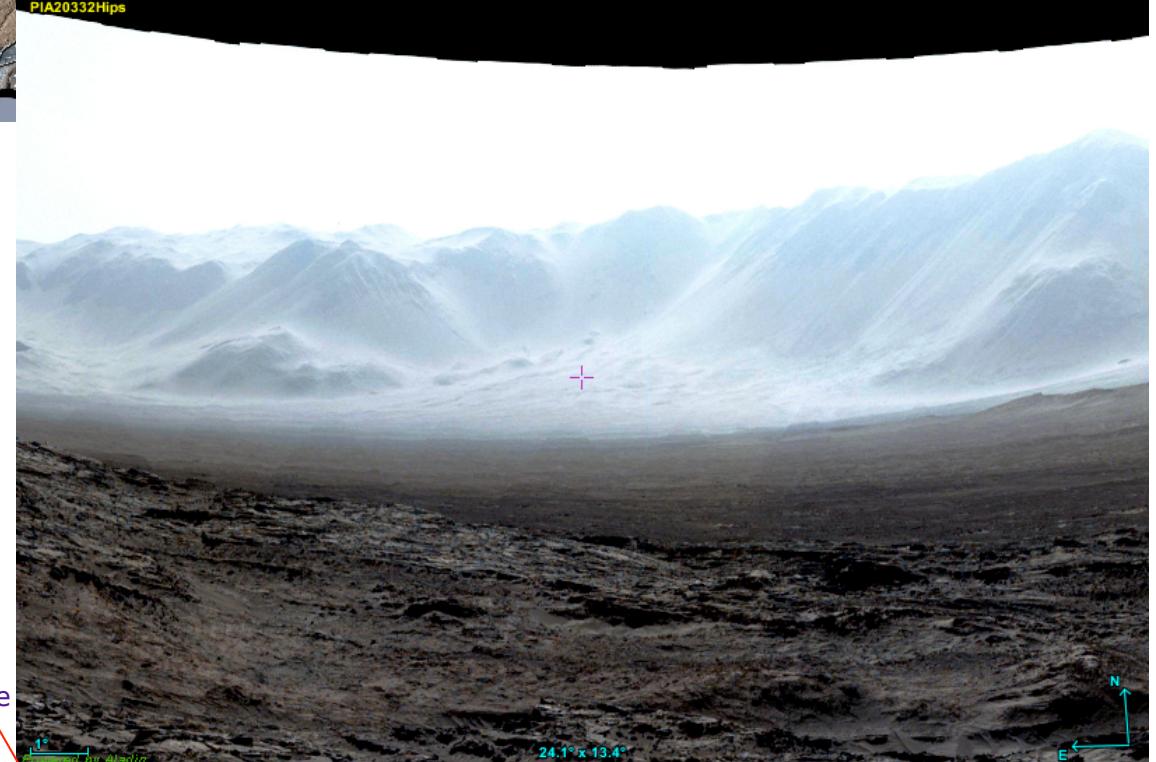

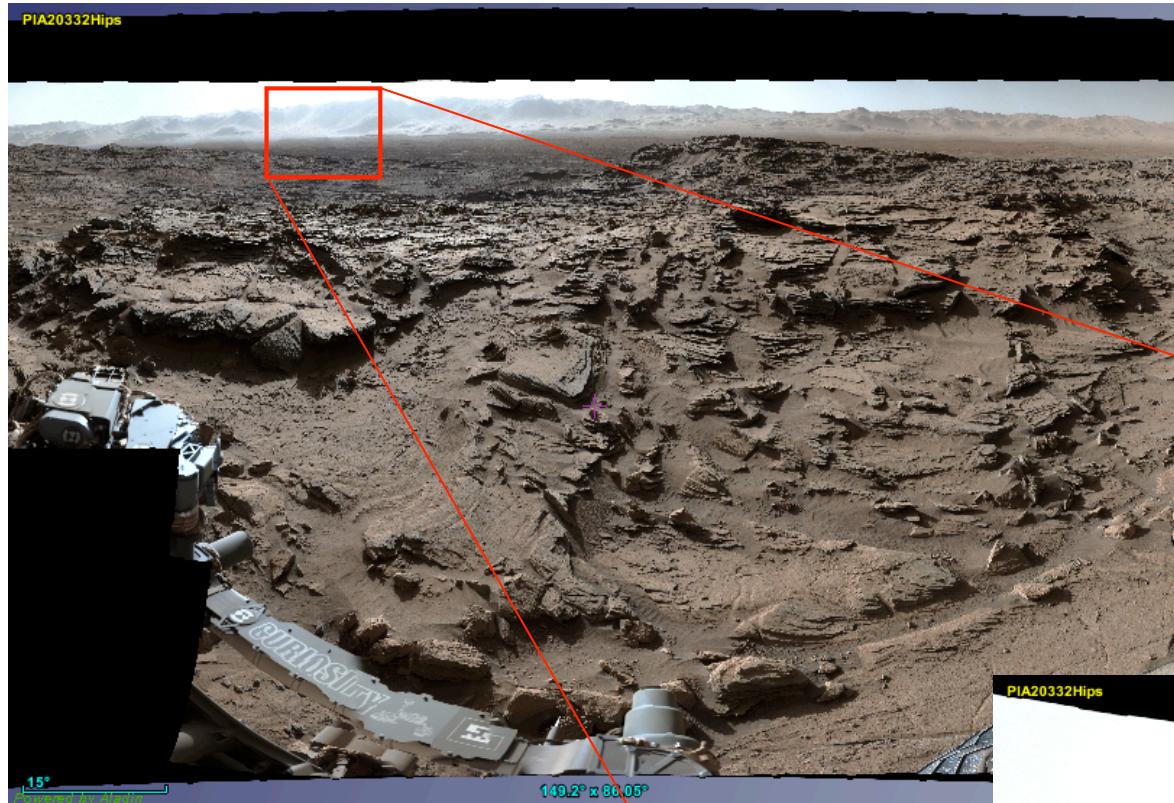

See also <http://aladin.u-strasbg.fr/AladinLite/doc/API/examples/mars-visualisation/>

Currently 61 planetary HiPS available for use (from USGS WMS maps and more)

## New VESPA functions

## Multiresolution in Aladin: panoramic images

HiPS computed from a Curiosity MASTCAM panorama from JPL web site  
(available in the Aladin data tree)

# Favorite VESPA tools

## Aladin (CDS/CNRS): Georeferenced images + objects superpositions

The screenshot displays the Aladin software interface, version v10.0 (Beta), showing two main panels. The left panel shows a 3D globe of Mars with various geological features highlighted in different colors (blue, green, yellow, red) and a shaded relief view. The right panel shows a detailed grayscale image of the Moon's surface with numerous craters labeled with names such as Hipparchus, Pickering, and Albeda. A legend on the right side identifies the data sources: CDS/P/Mars/THEMIS-Day-100m and CDS/P/Moon/Kaguya-Evening-V04-37.4m. The interface includes a toolbar with various selection and drawing tools, and a status bar at the bottom providing coordinates and other information.

Available data → 21016 / 21019

Mars MOLA-color

Mars THEMIS-Day-100m

Mars MOLA color

Lunar crater catalogue over Kaguya HiPS

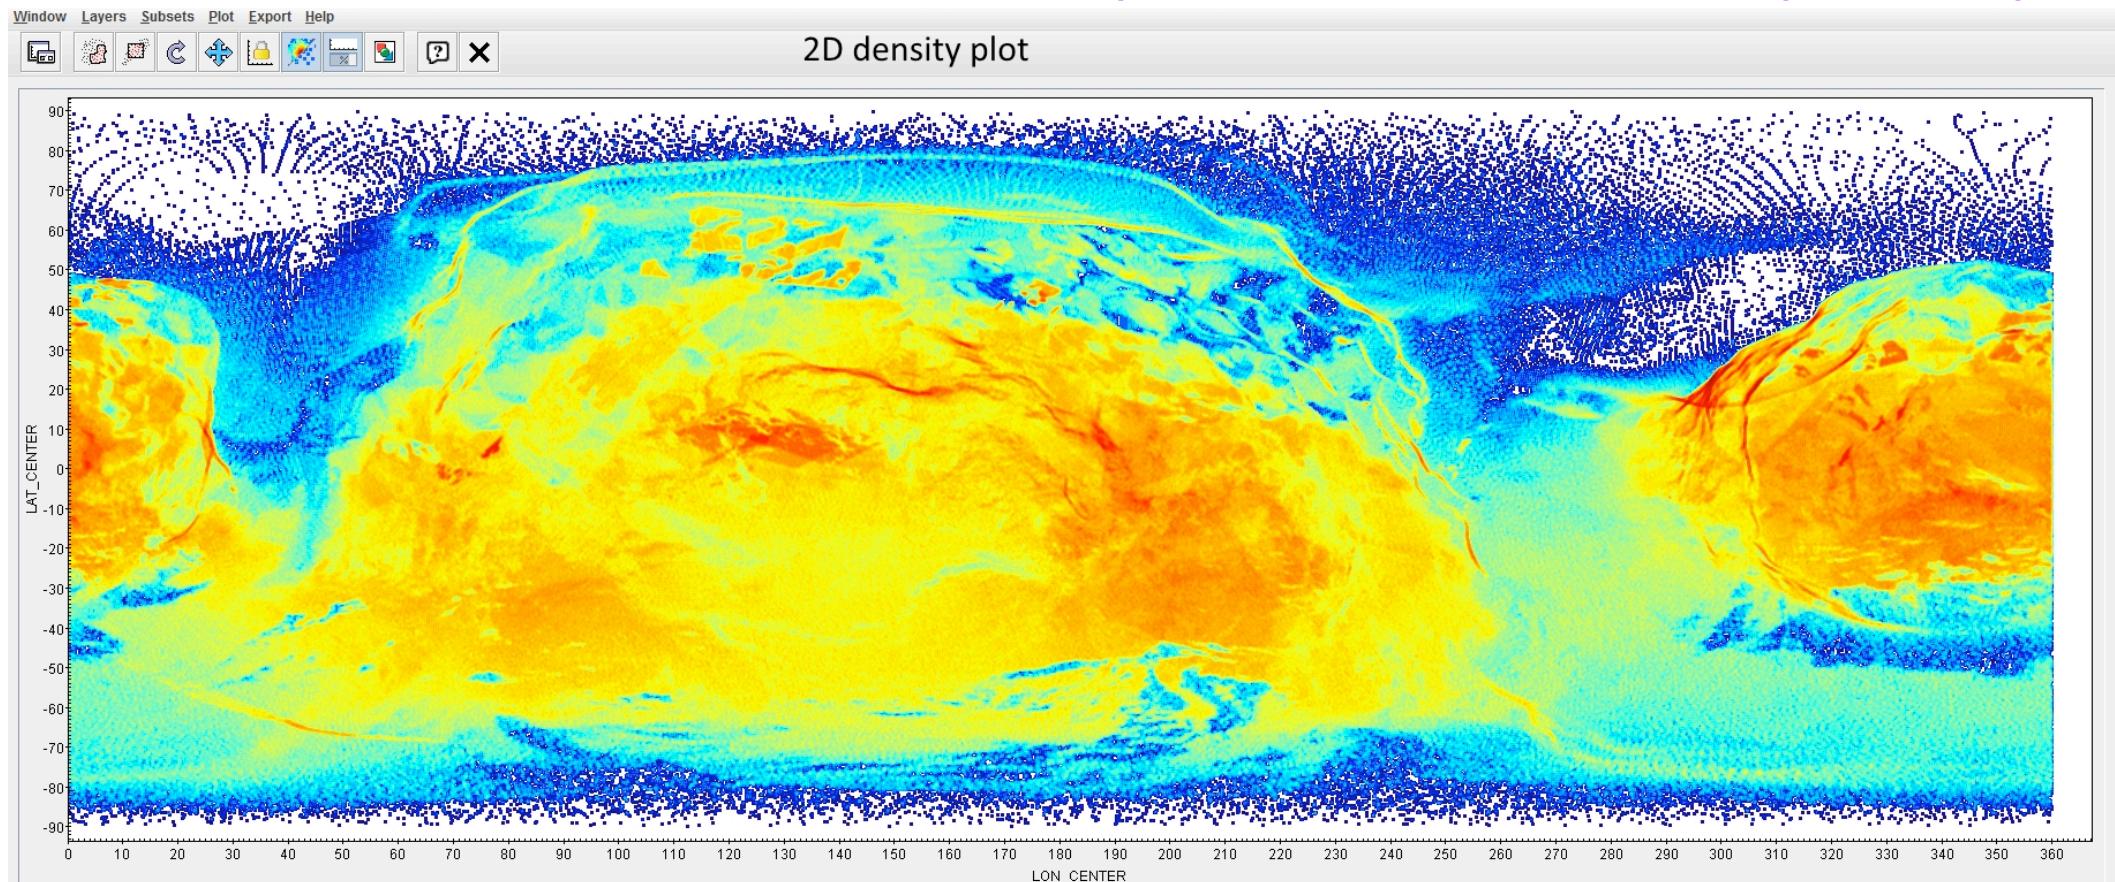

CRISM cubes over MOLA HiPS

Relies on IAU planetary coordinate frames (fits' WCS)

## Favorite VESPA tools

## Mapping capabilities in TOPCAT

From a list of point measurements  
Convolves with marker symbol/size  
=> powerful to visualize an operation plan

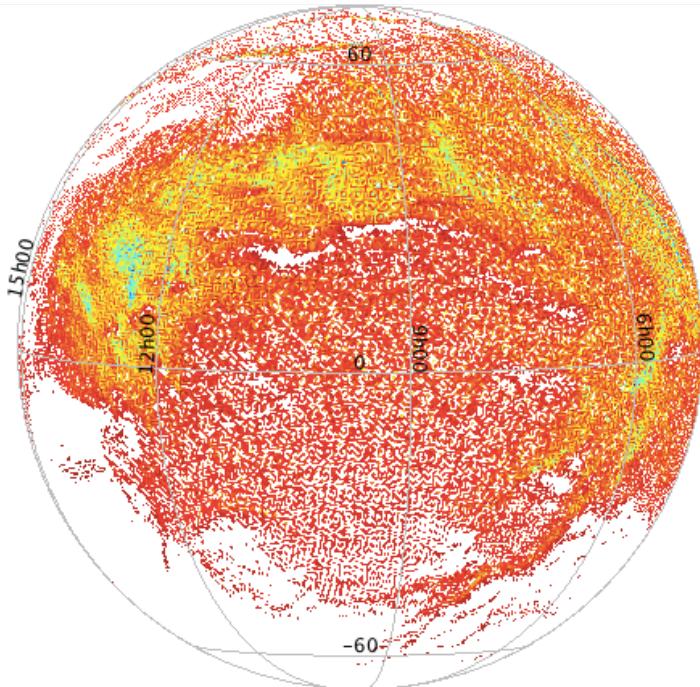

TOPCAT(3): Table Browser

## New functions in VESPA

Virtis/Rosetta coverage of 67P for a selected mission phase, scale = 7

## Multiresolution maps in TOPCAT (Bristol Univ)

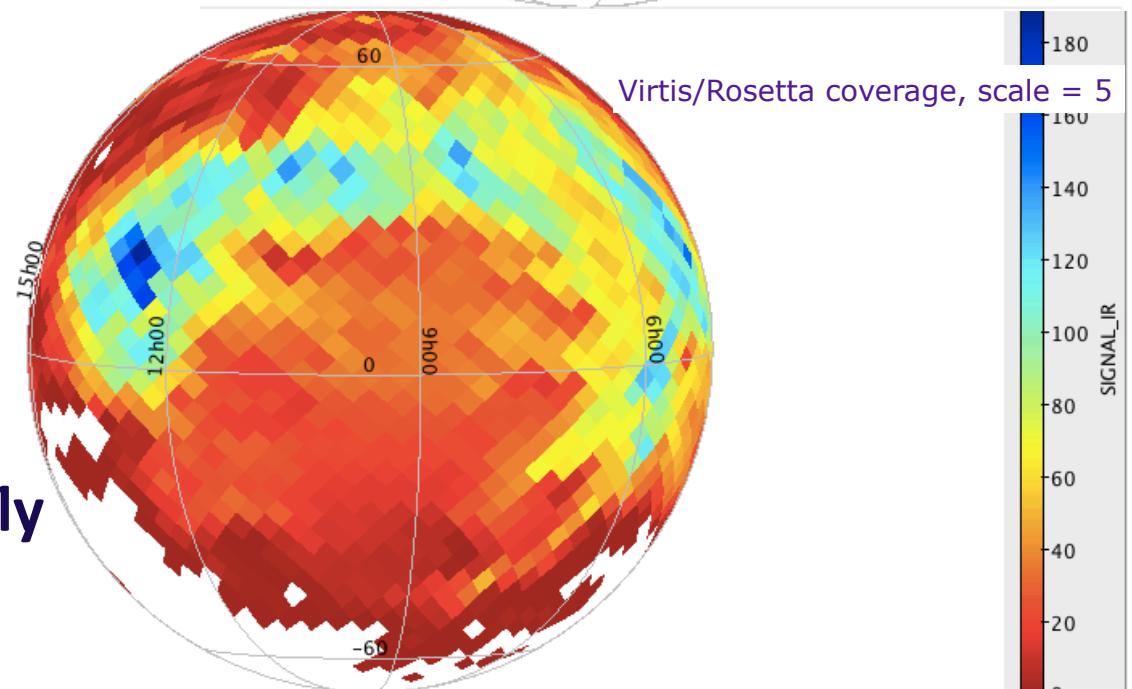

**Start from a table of sparse observations (lon/lat)**

VIRTIS/Rosetta on 67P

**Integrate / average on healpix cells (including overlaps)**

**Modify resolution / scale on the fly**

Output format now consistent with Aladin

## Typical workflow in imaging spectroscopy from PDS format

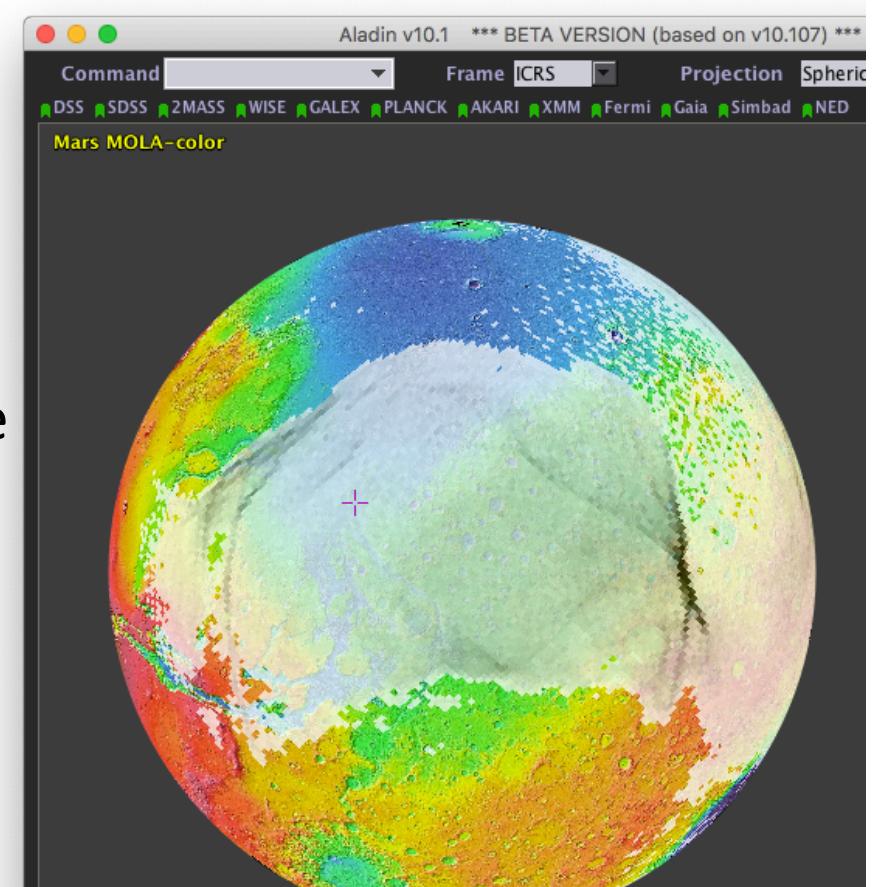

- identify cubes of interest from EPN-TAP query
- read file, select pixels, process under IDL | python (or TOPCAT?)
- write in VOtable, open in TOPCAT for spatial integration in healpix cells
- Plot result in Aladin over HiPS

### Applications:

- VIR/Dawn spectral parameter over Ceres HiPS in Aladin
- OMEGA spectral parameter over Mars HiPS
- any point measurements (altimeter, etc)

=> Alternative:

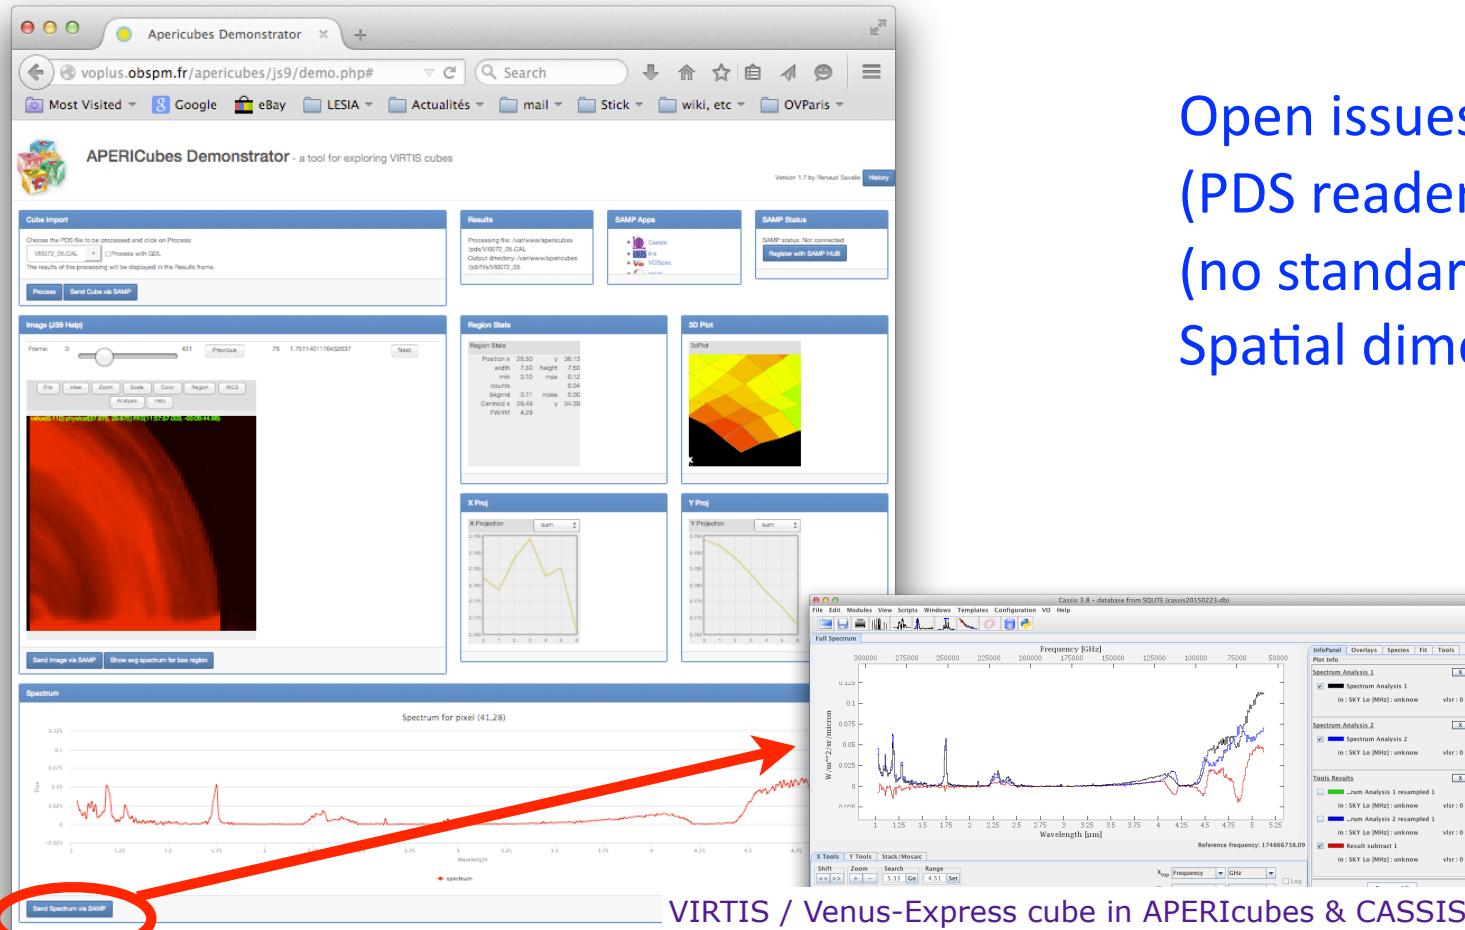

- provide *individual* spectra in EPN-TAP service
- + access tool (being tested on VIRTIS / VEx)

TOPCAT healpix map (scale = 6) over MOLA HiPS in Aladin - dummy example

# Nice solution to browse imaging spectroscopy data

- 1- EPN-TAP service describing *cubes* with geometry range (coord / angles)
  - => retrieve sessions of interest
  - => Aladin, DS9, APERICubes (which allows extracting spectra)
- 2- add EPN-TAP service describing *pixels* with geometry (coord / angles)
  - => retrieve measurements of interest, comparison with HR imaging
  - => CASSIS, SPLAT-VO (or TOPCAT for 2D aspects)

VIRTIS / Venus-Express cube in APERICubes & CASSIS

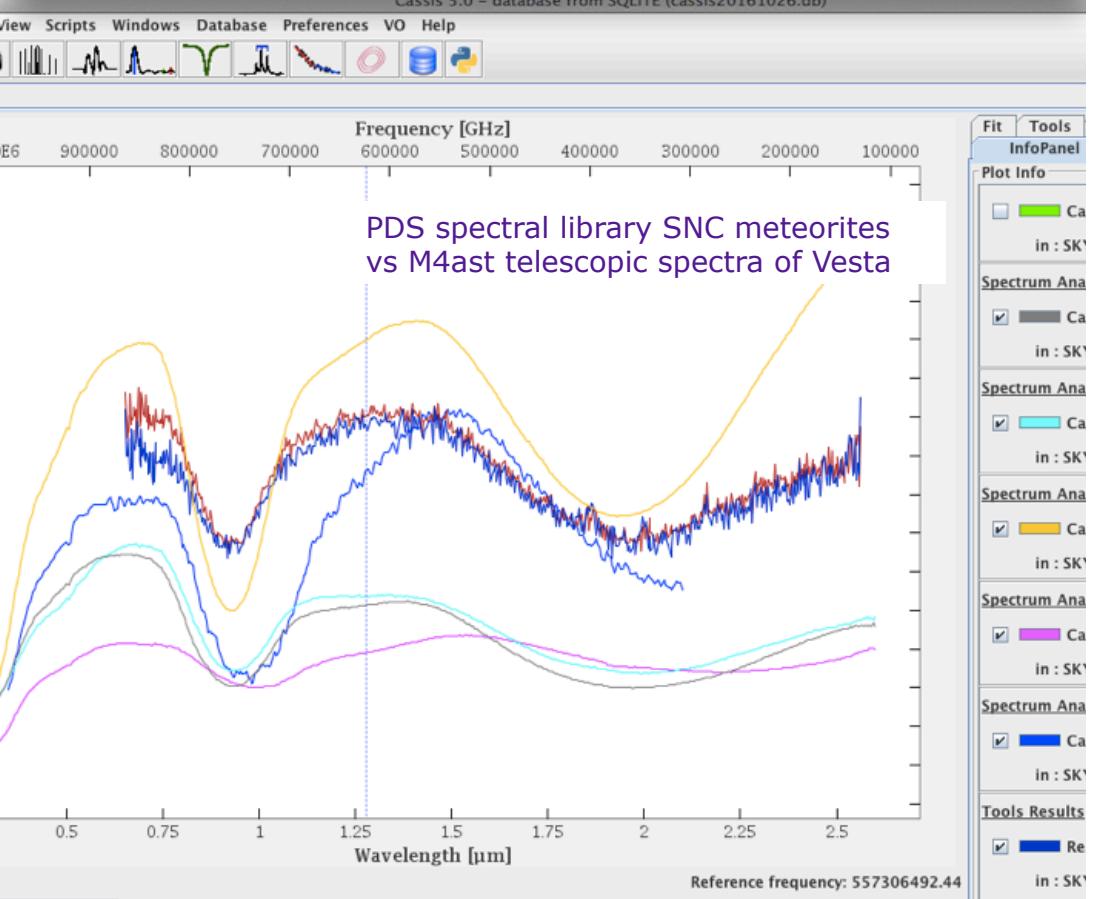

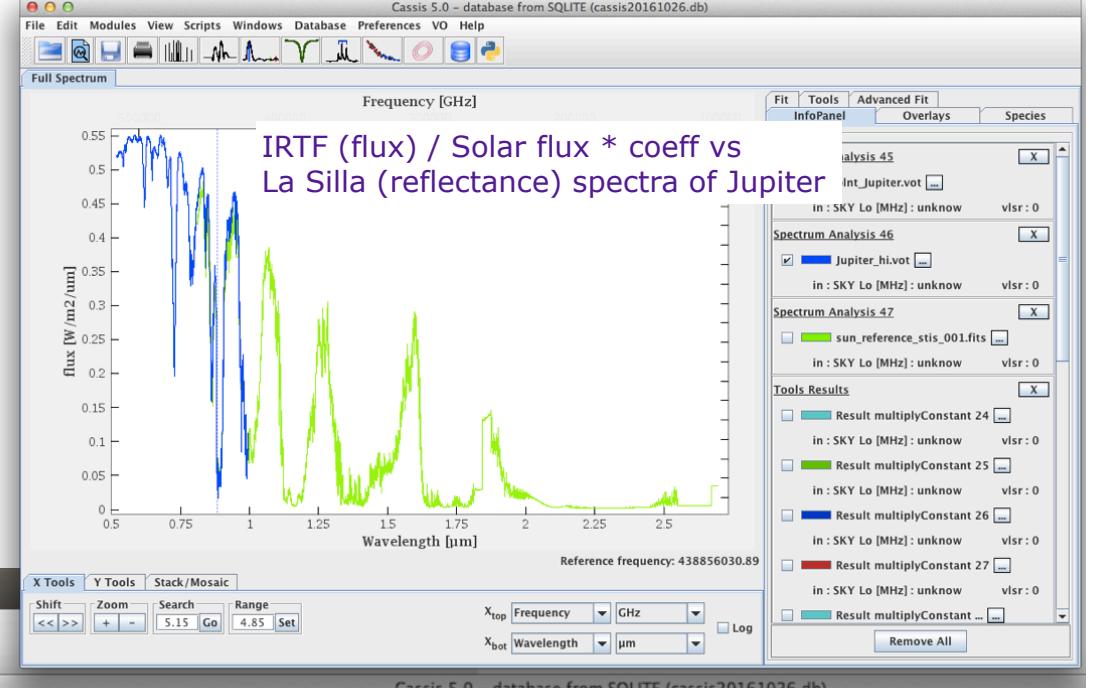

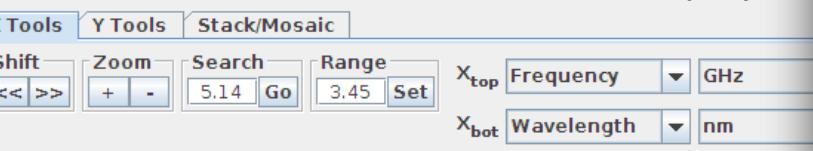

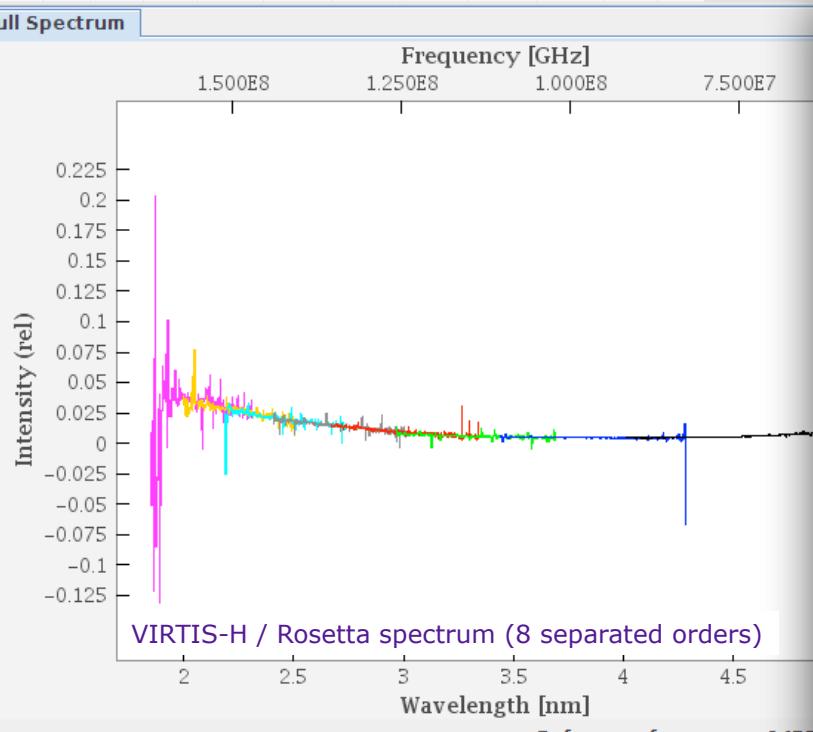

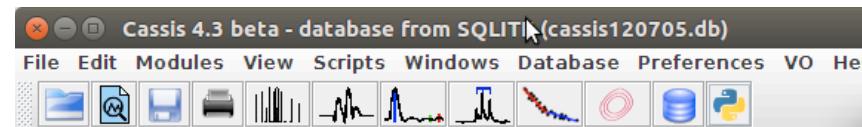

Open issues with data format  
(PDS reader?) & representation  
(no standard cube format)  
Spatial dimension is neglected

Similar extraction  
function is provided by  
VESPA GIS interface for  
CRISM service

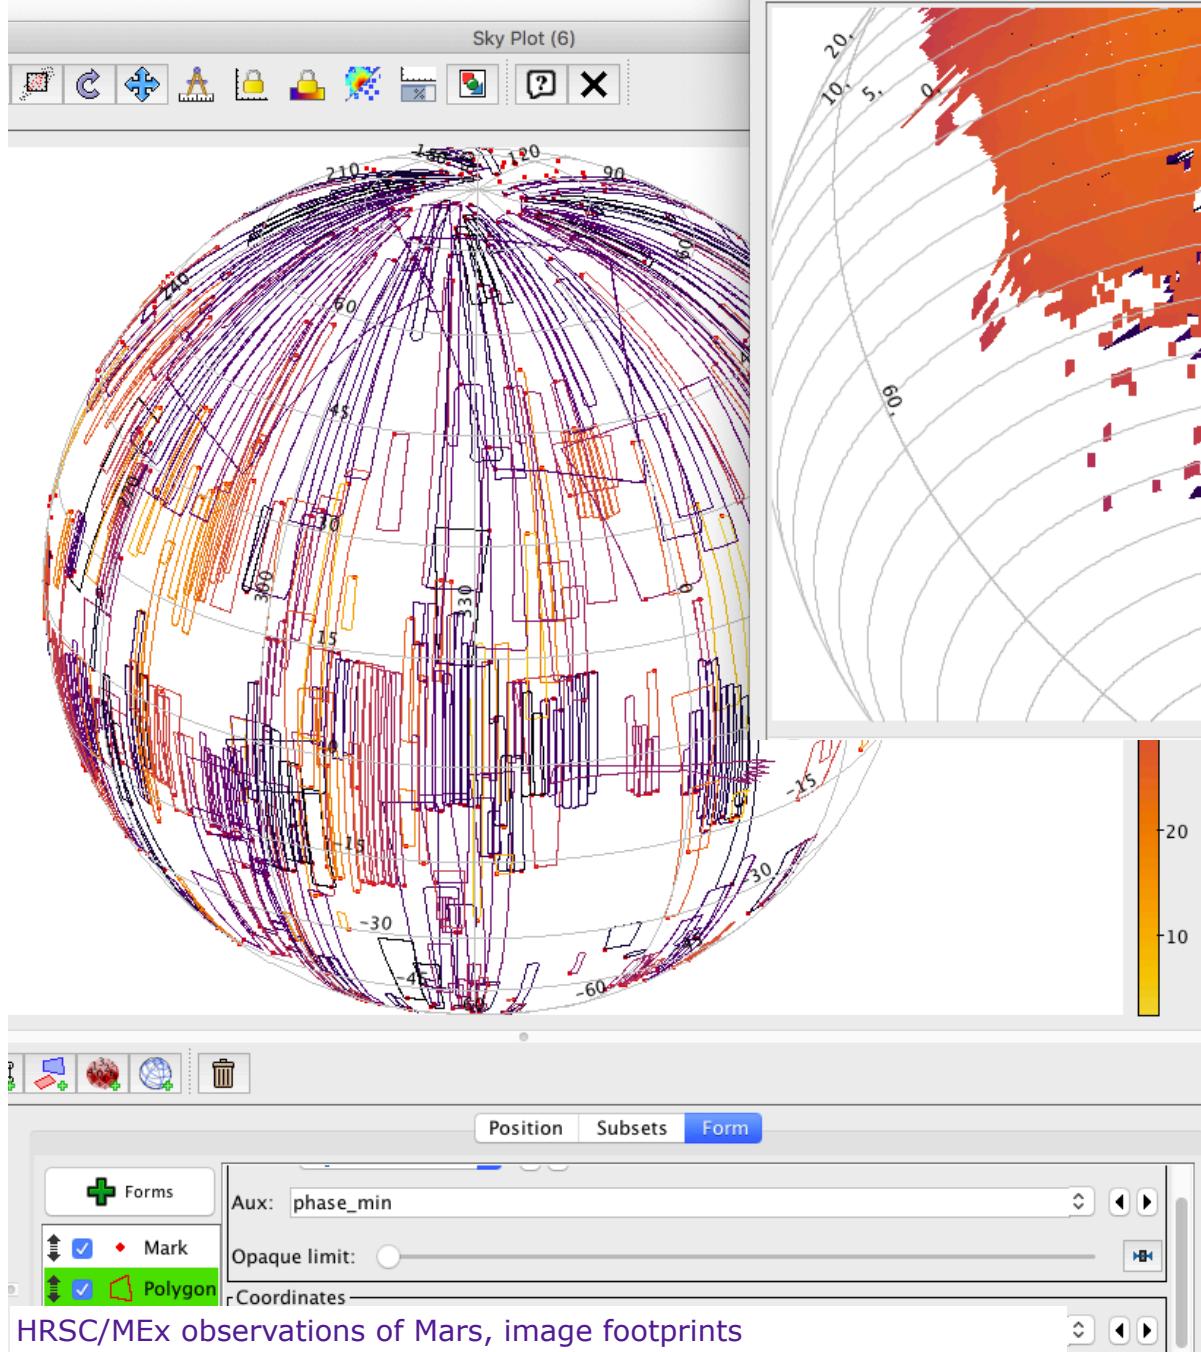

# Favorite VESPA tools

## CASSIS v5 (IRAP/CNRS)

- Supports data in flux & various types of reflectance (scaling)
- Auto converts spectral axis & flux
- Supports échelle spectra

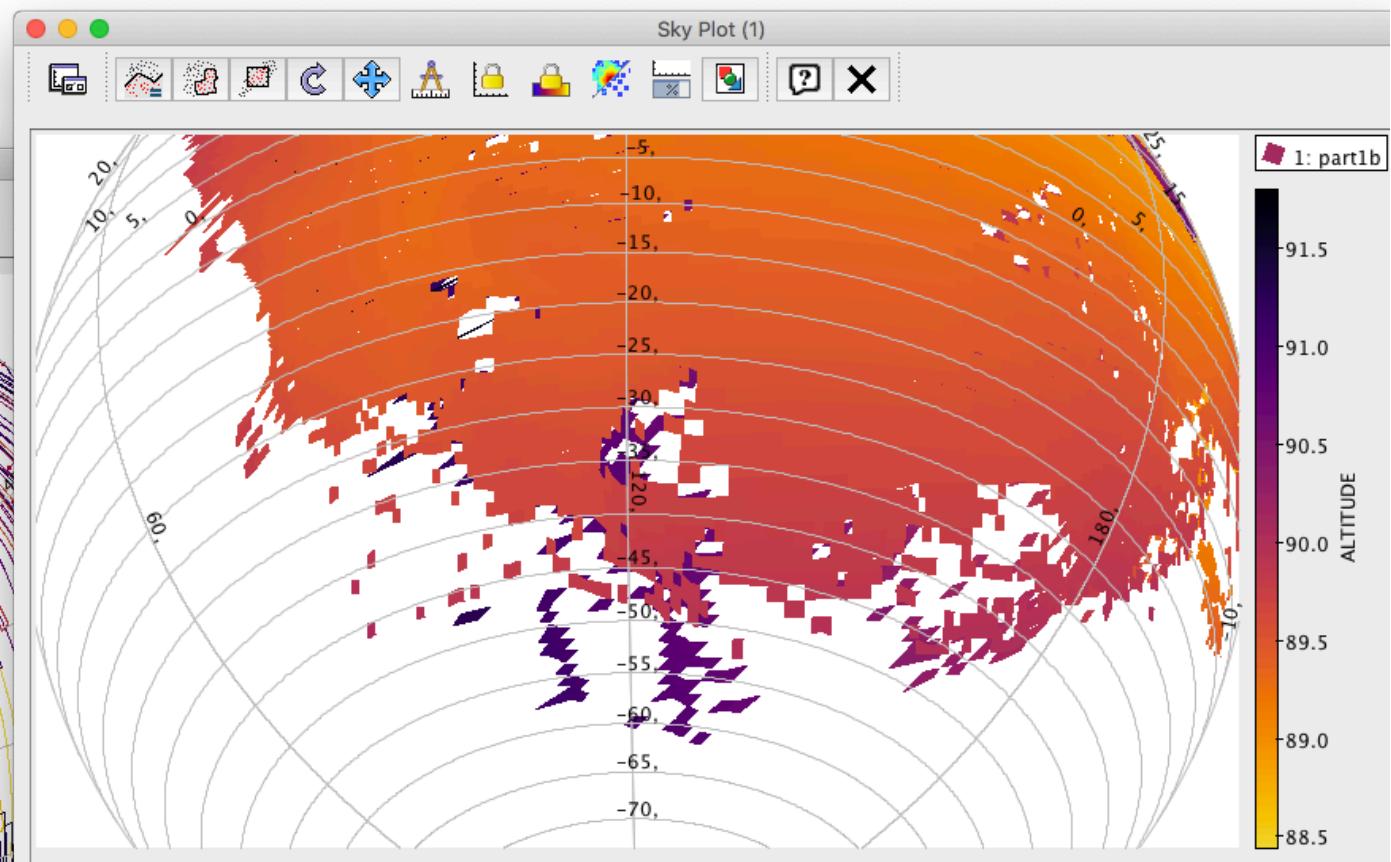

## New functions in VESPA

HRSC/MEx observations of Mars, image footprints

## Support for extended pixels in TOPCAT

VIRTIS/Rosetta observations of 67P, individual pixels

Position is defined by a quadrilateral instead of a point

**Particularly useful for imaging spectroscopy and to display image footprints**

# Fits extensions & GIS interface

## geofits

- fits/WCS extension for planetary surfaces

Extends the WCS standard for planetary coordinates, including description of projection in use — handled by fits software (ds9, Aladin...)

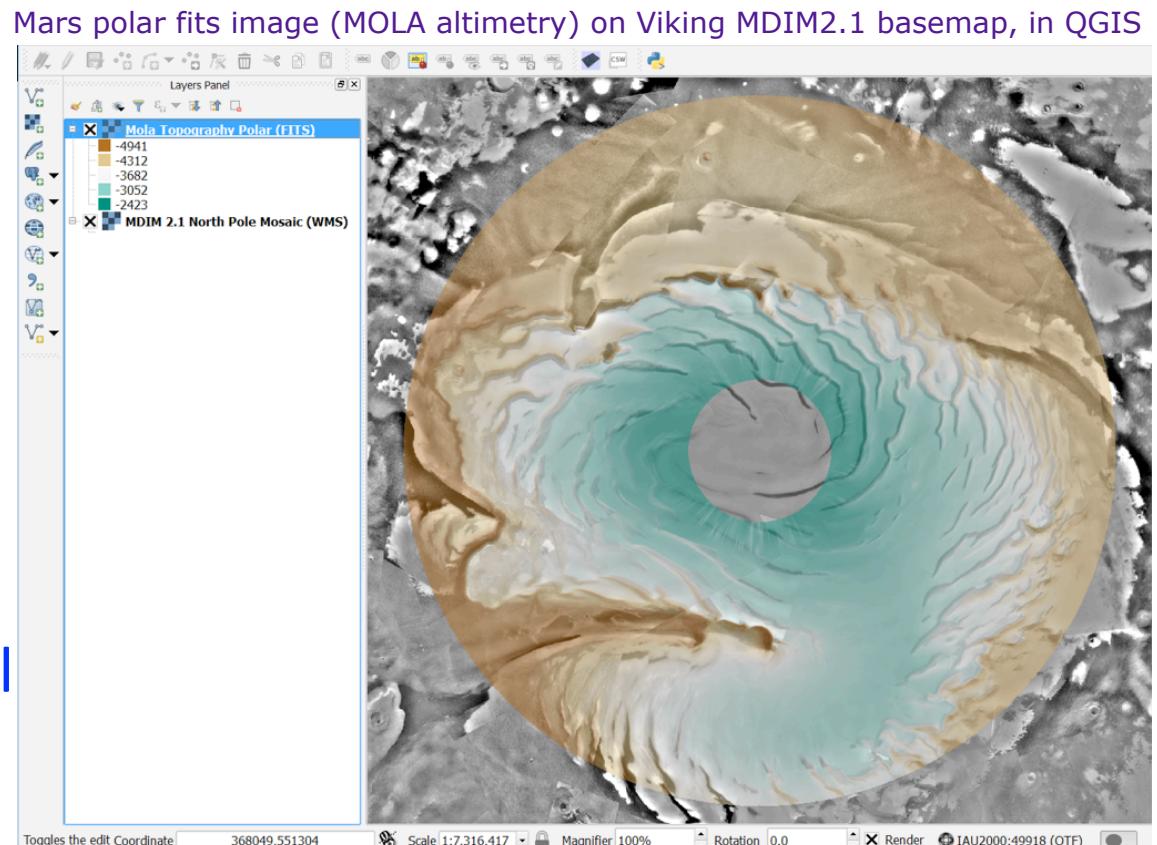

*Marmo et al 2018, Earth & Space Sc*

Driver included in GDAL from v3.0:

- georeferenced fits files can be converted & projected in QGIS
- *geoTIFF* files can be converted to *geofits* for use in VO tools

Associated to QGIS SAMP plug-in:

=> QGIS can receive fits from portal

## Fits extensions

### Fits cubes

- **(spectral cubes + coordinates + viewing geometry) in a multi-extension fits file**

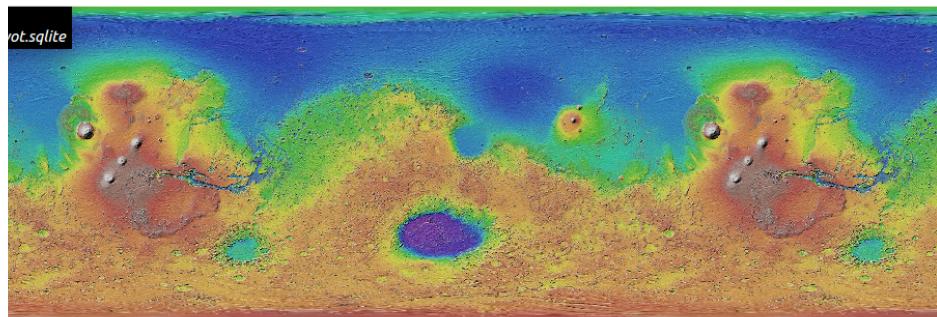

Assessment based on VIRTIS / VEx experiment

=> demo that imaging spectroscopy data, with ancillary information, can be provided in fits & embedded in PDS4

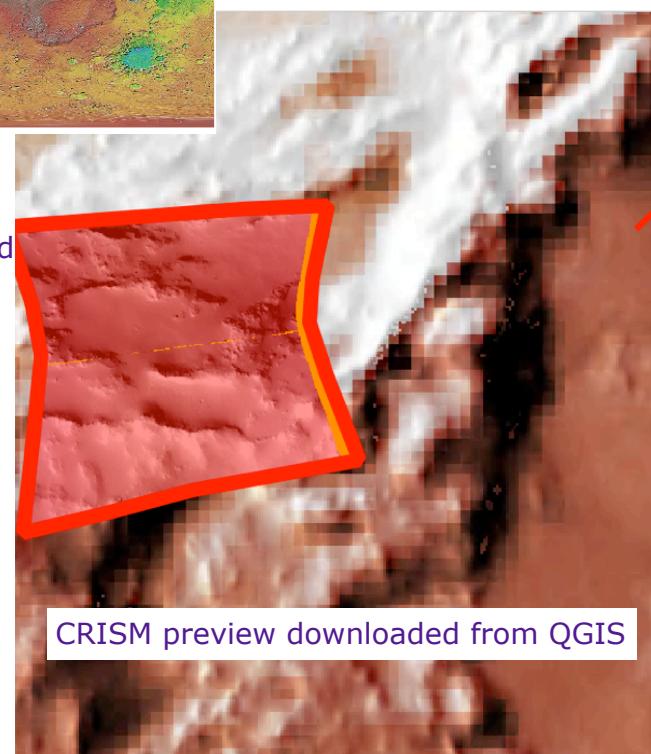

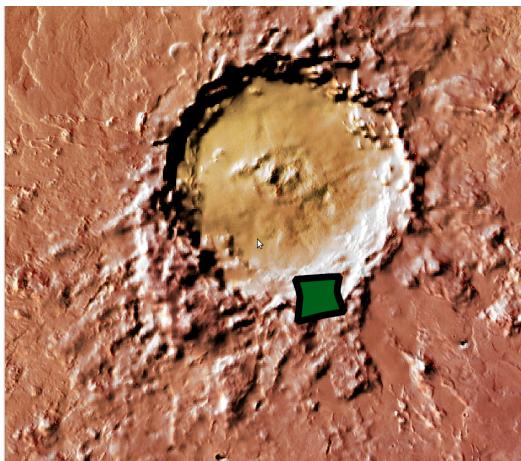

# Typical workflow in imaging spectroscopy involving GIS queries

- identify CRISM granules (cubes) of interest from EPN-TAP query
- passes WMS queries to QGIS (via new SAMP plug-in), plot maps
- passes WCS footprints to QGIS, forward to Aladin
- New Image plug-in downloads the preview
- subgranule module browses spectra, forward to CASSIS

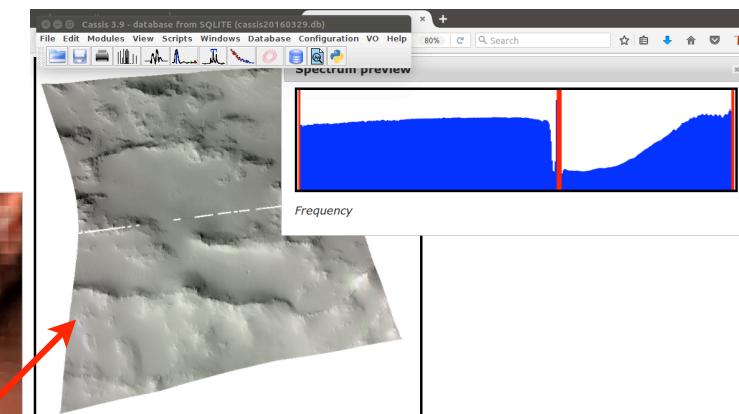

USCS\_WMS map SAMPed to QGIS from VESPA portal

CRISM footprint SAMPed from portal & overplotted

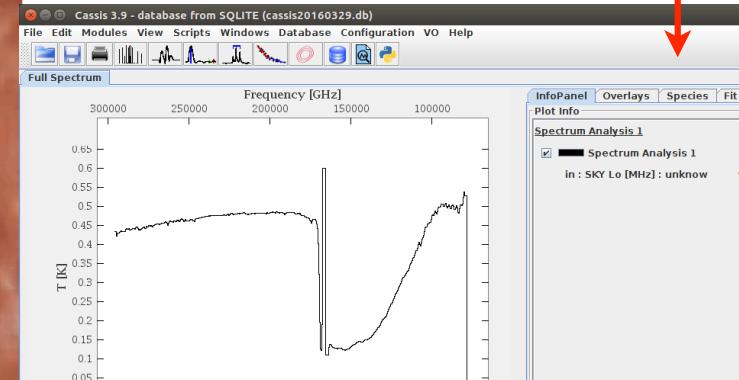

CRISM preview downloaded from QGIS

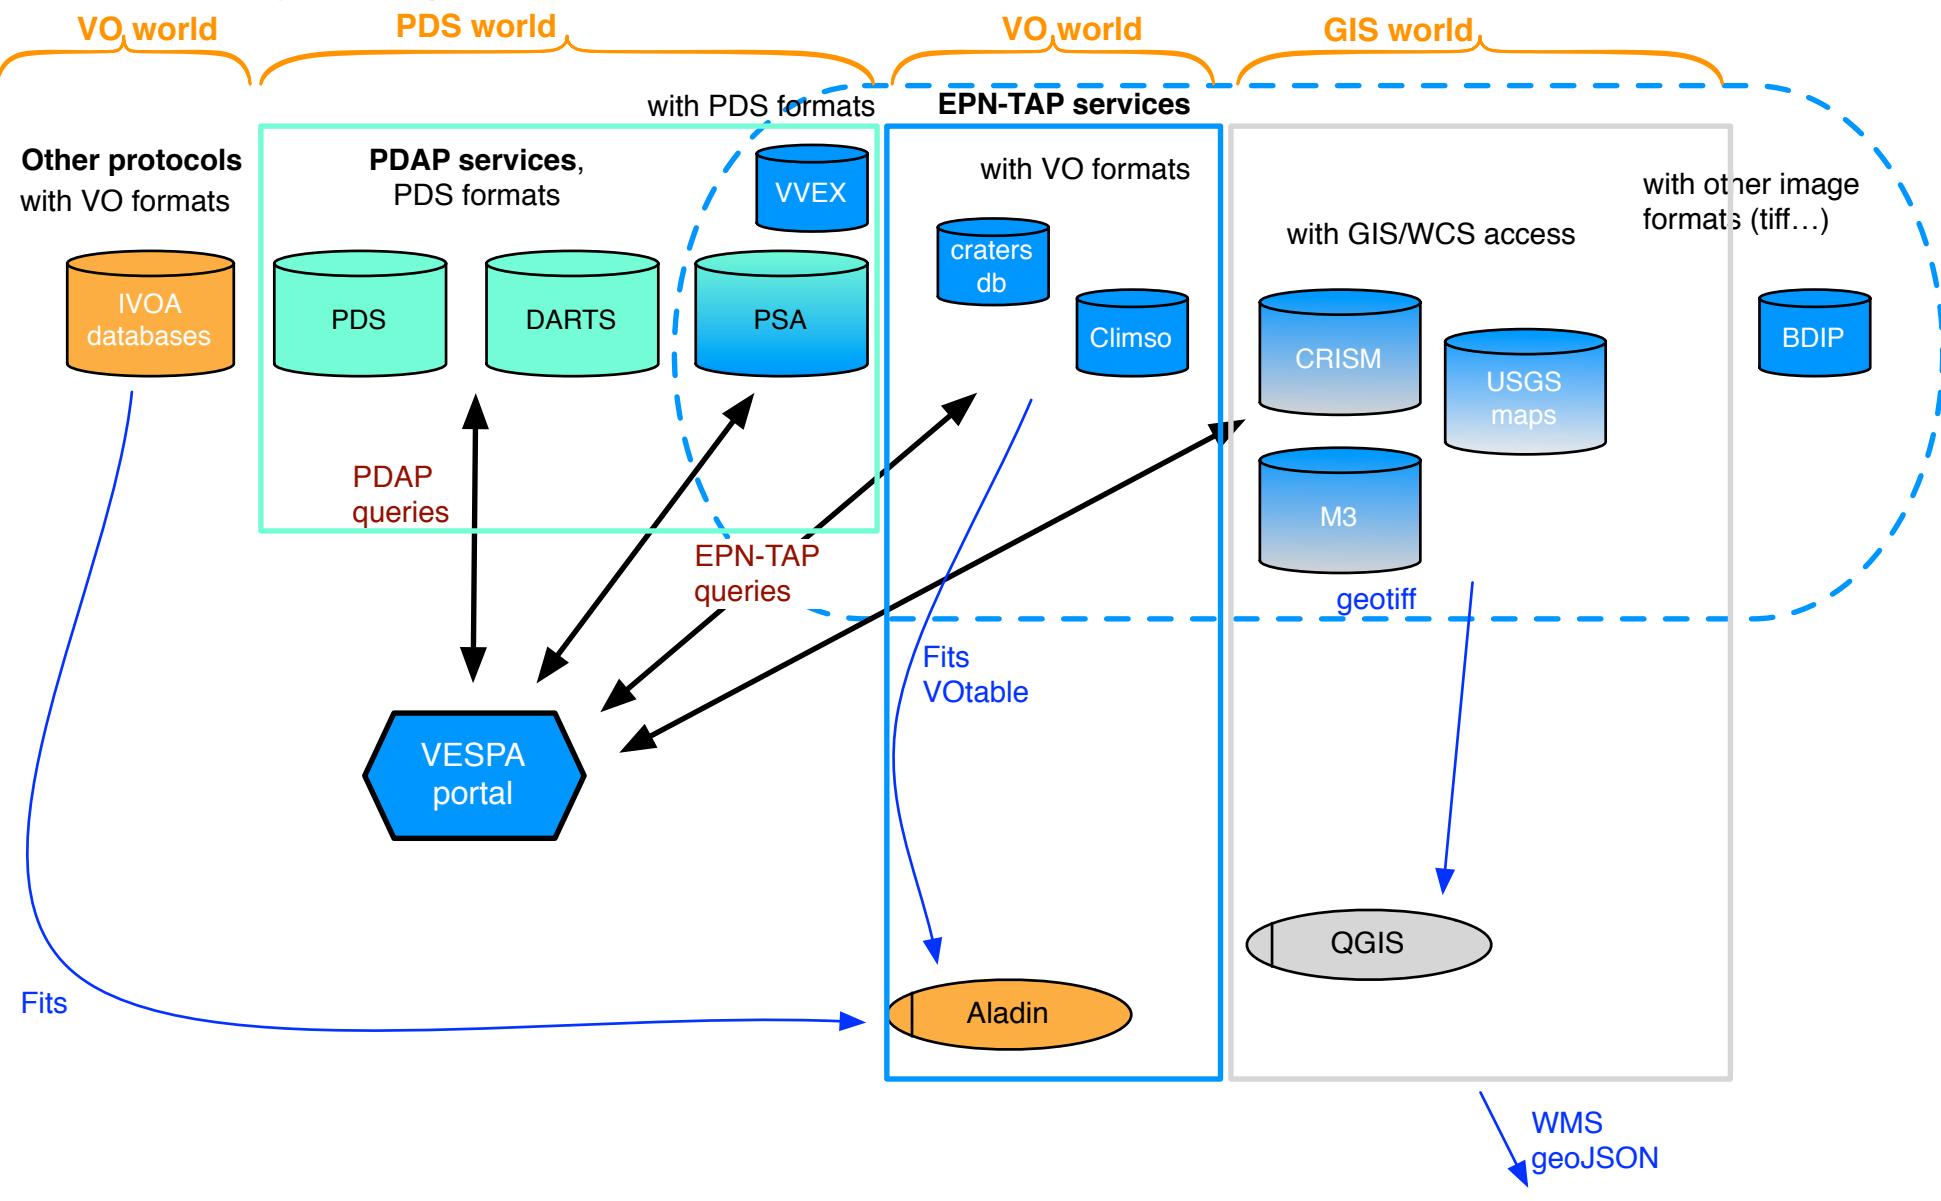

Click on the image, spectrum for that location will appear on the box below:  
Copy and paste it in a text editor and save as .fus, open with CASSIS.

Subgranule module browses cube in portal

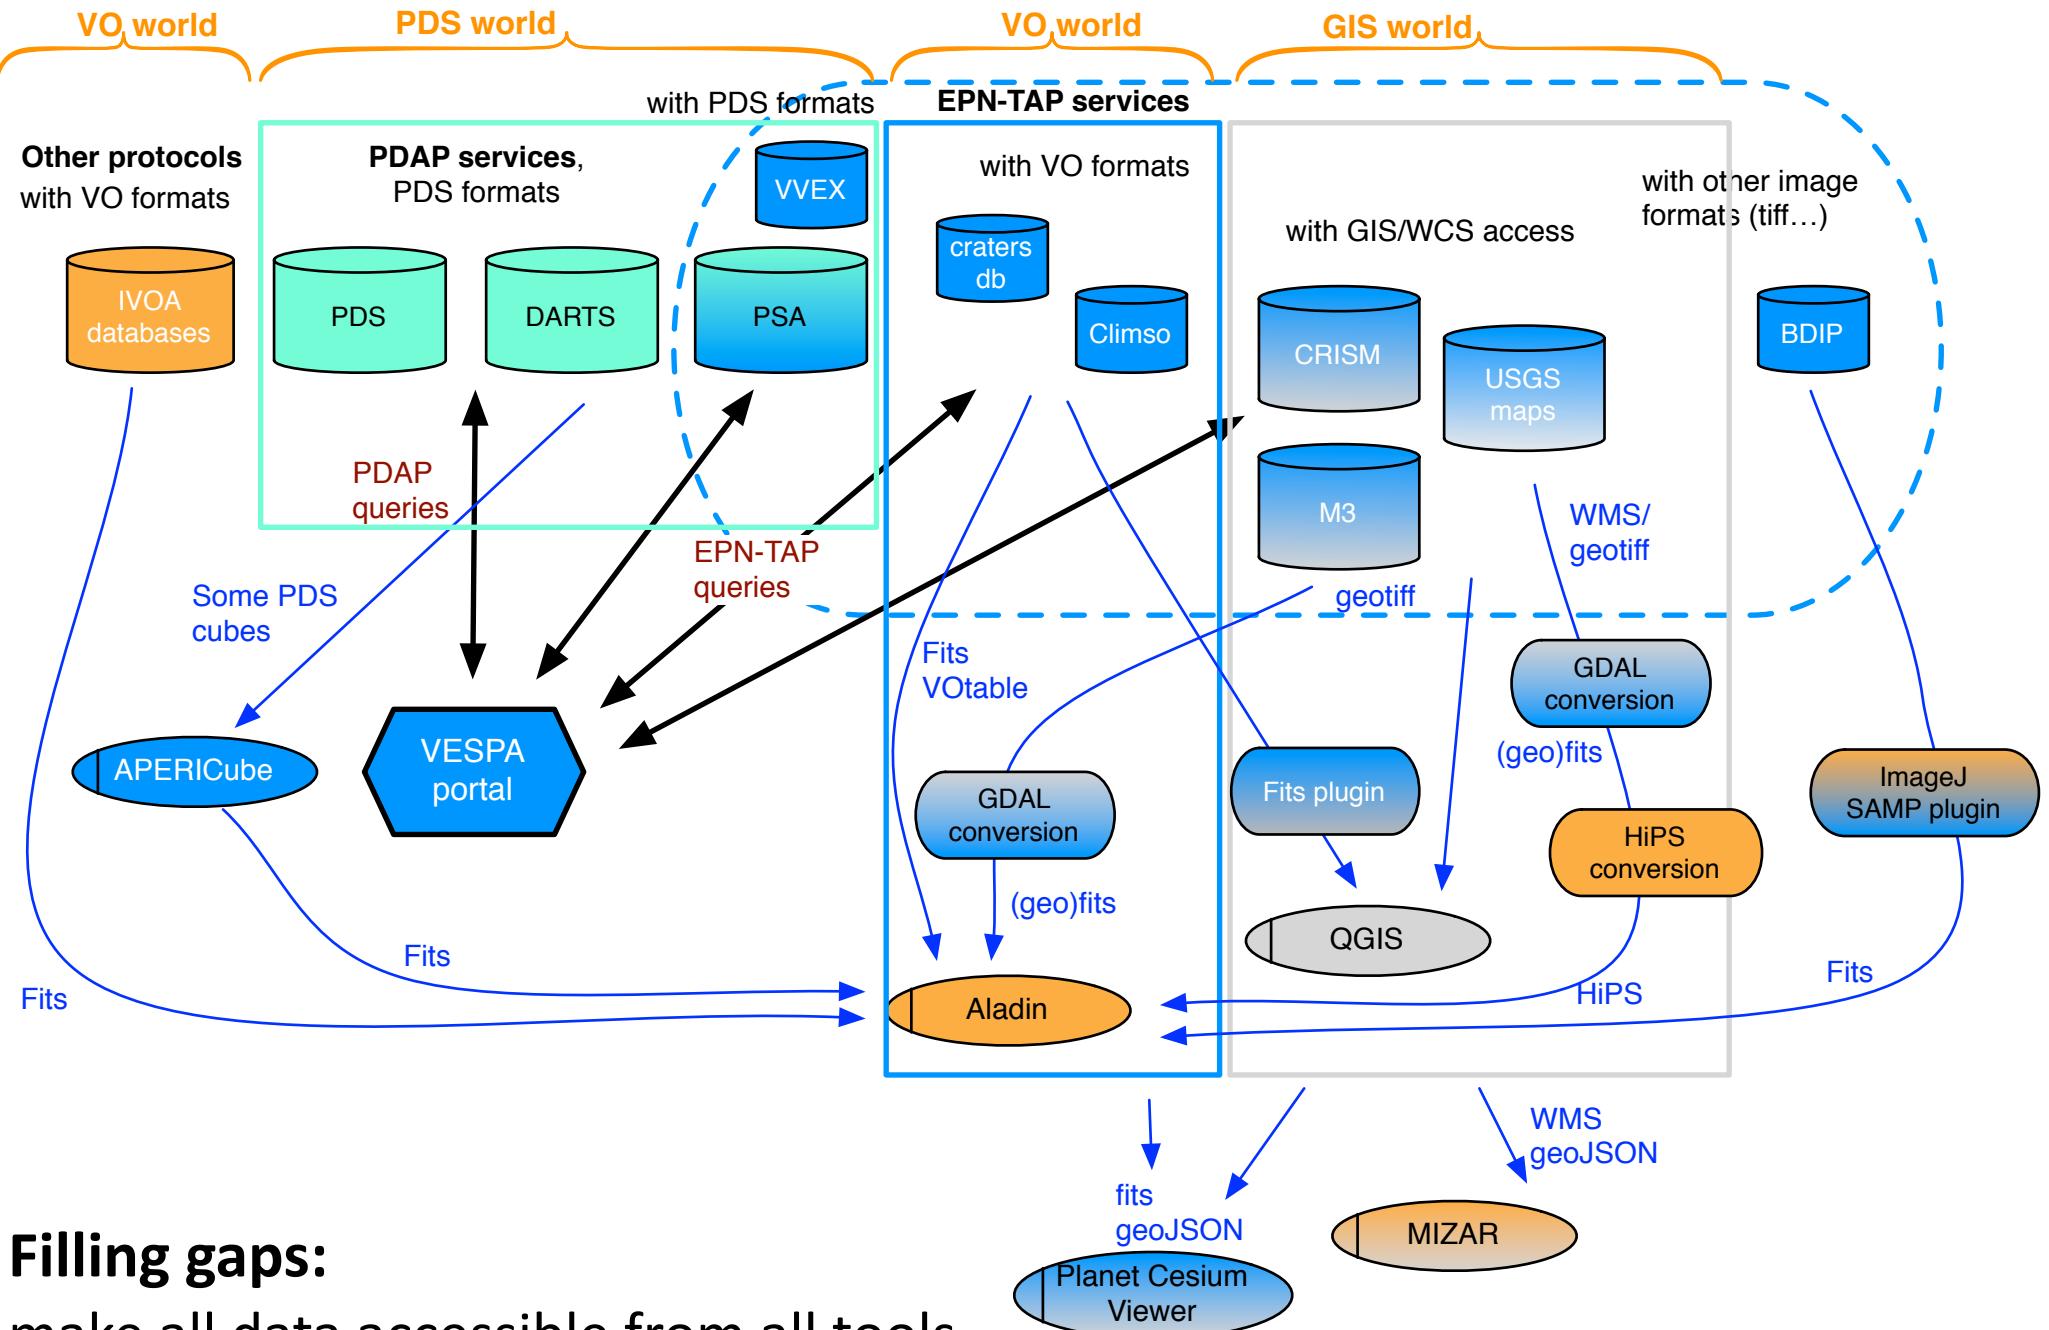

Spectrum forwarded to CASSIS

# Planetary images: data and tools

**3 worlds that hardly communicate**  
but EPN-TAP allows for searches in data services

# Planetary images: data and tools

## VESPA VO-GIS bridge, summary

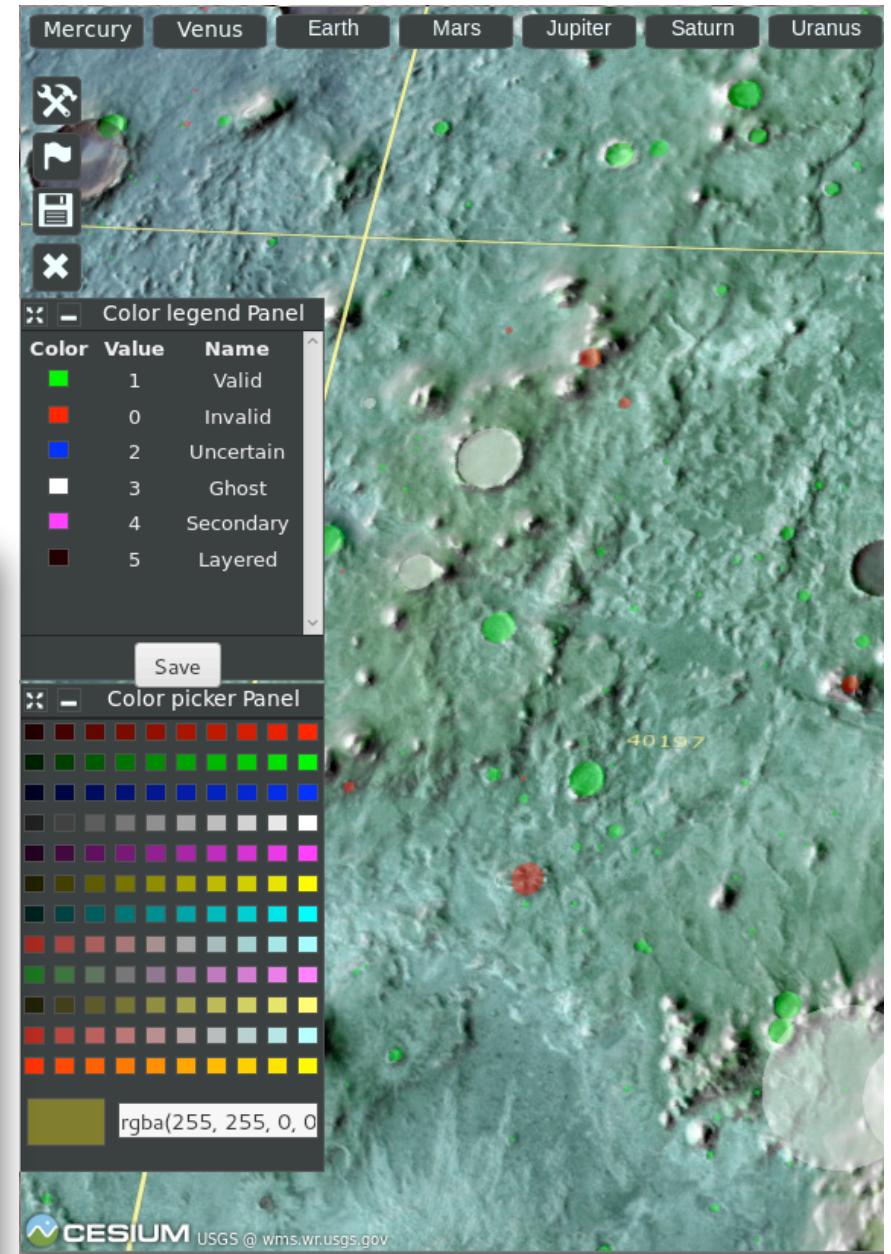

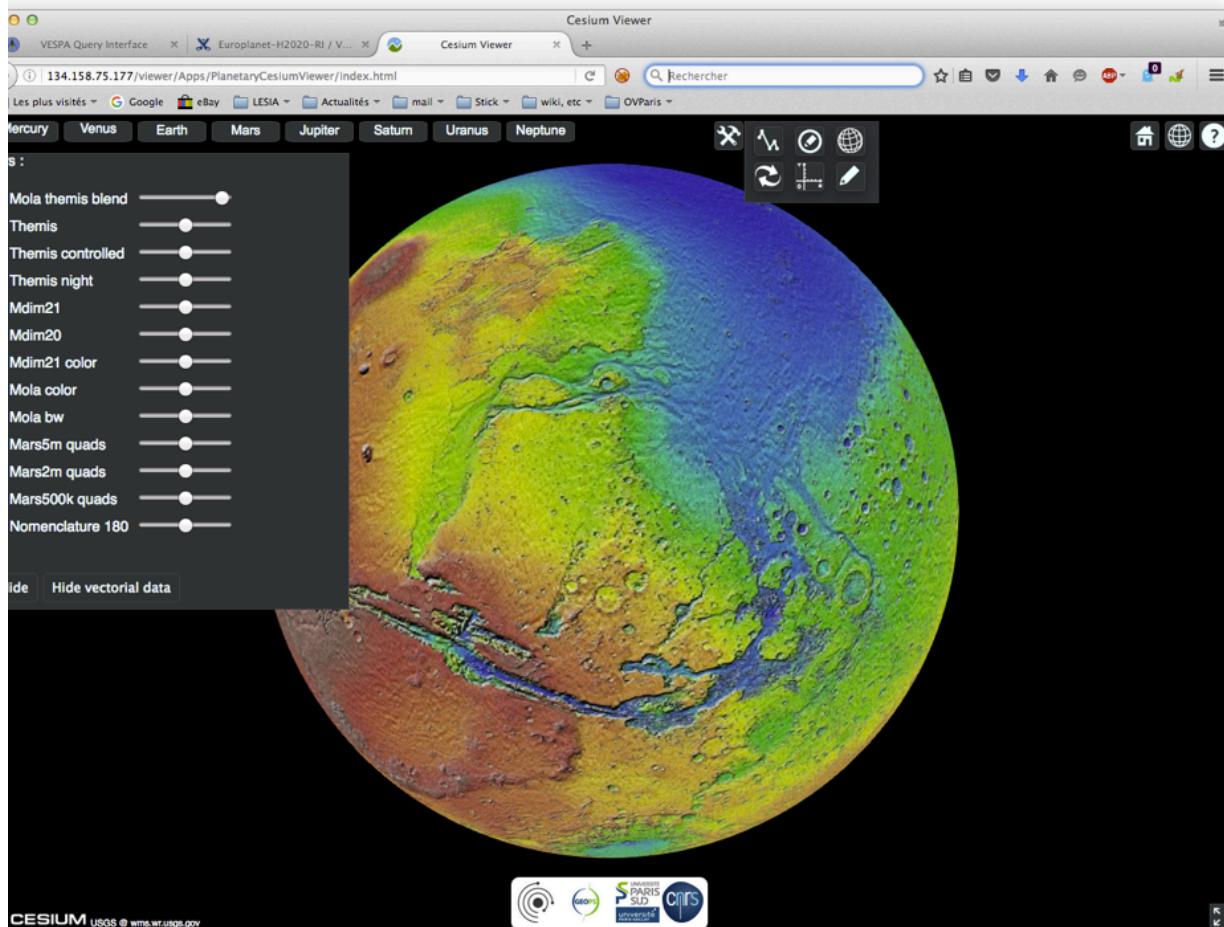

- EPN-TAP services can provide WMS or WCS requests instead of file URL (currently CRISM, M3, USGS\_maps, HRSC) - add service for MarsSI outputs?
- These data can be sent to QGIS (open source, terrestrial)  
Planetary GIS such as JMars are closed and can't be used as viewers
- Format conversion relies on GDAL library (extended fits <=> geotiff)  
Can be included in workflows (fits handled in QGIS)
- Tools connection relies on SAMP
- USGS reference maps (WMS/geotiff) are converted to HiPS for use in Aladin and other clients (other HiPS generated from different formats)
- Contours can be converted STC-S <=> geojson (coord syst ID required)  
DaCHS provides conversion to geojson (in progress)
- Contours can be sent from QGIS to Aladin (as STC-S)
- geojson bounding boxes are produced by VESPA portal for quick display

# New VESPA tool

## Planetary Cesium Viewer (GEOPS/CNRS)

- Quick multiresolution 3D visu
- Supports ellipsoids
- Annotation/validation tool
- SAMP implementation to come

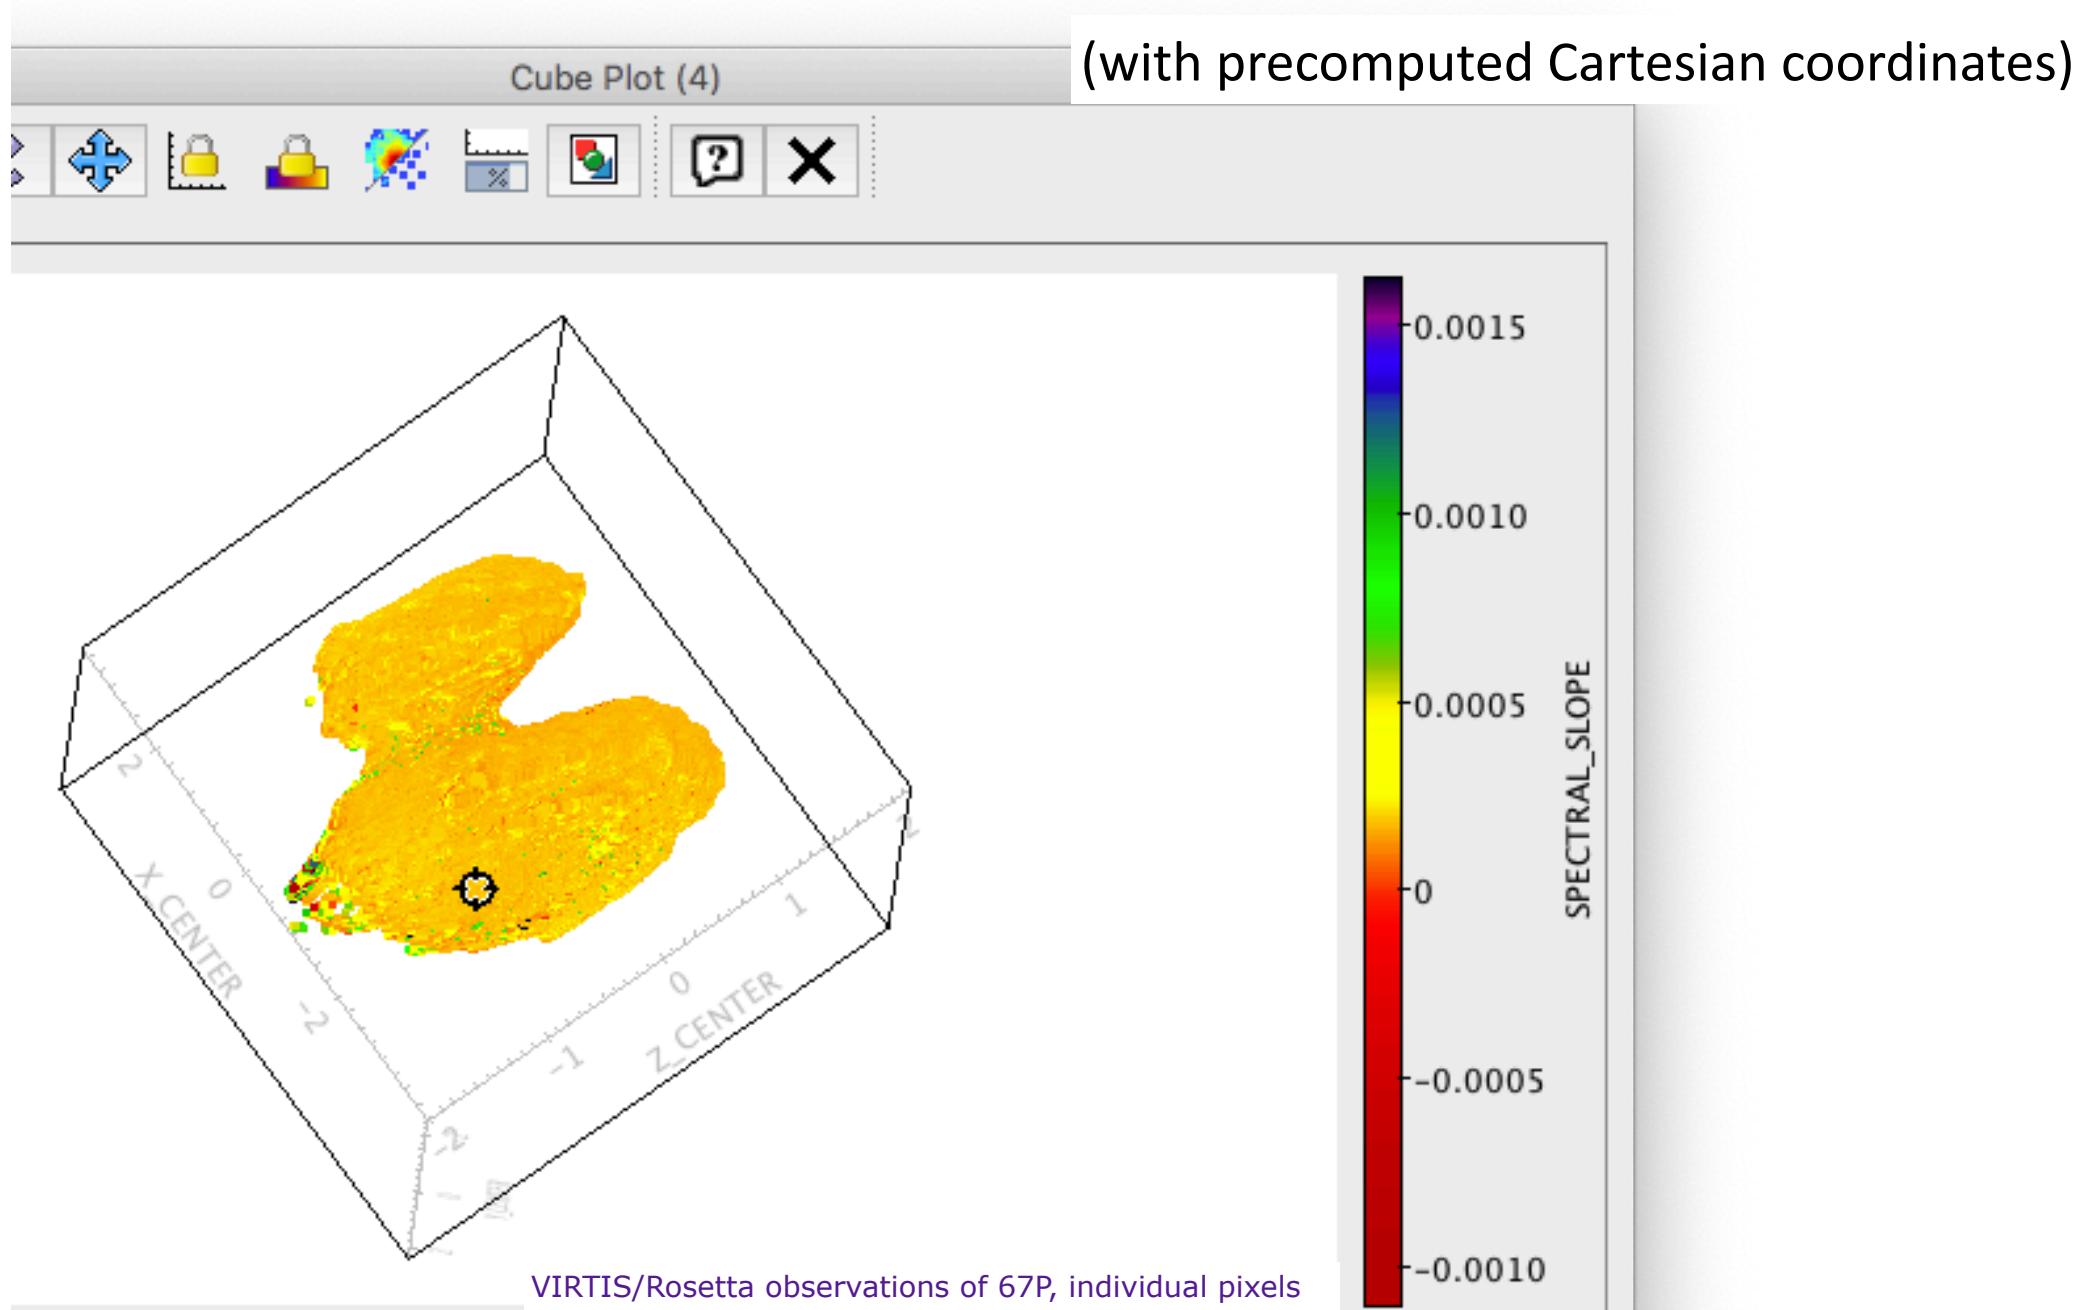

<http://134.158.75.177/viewer/Apps/PlanetaryCesiumViewer/index.html>

Robbins Mars craters database in PCV

## New functions in VESPA

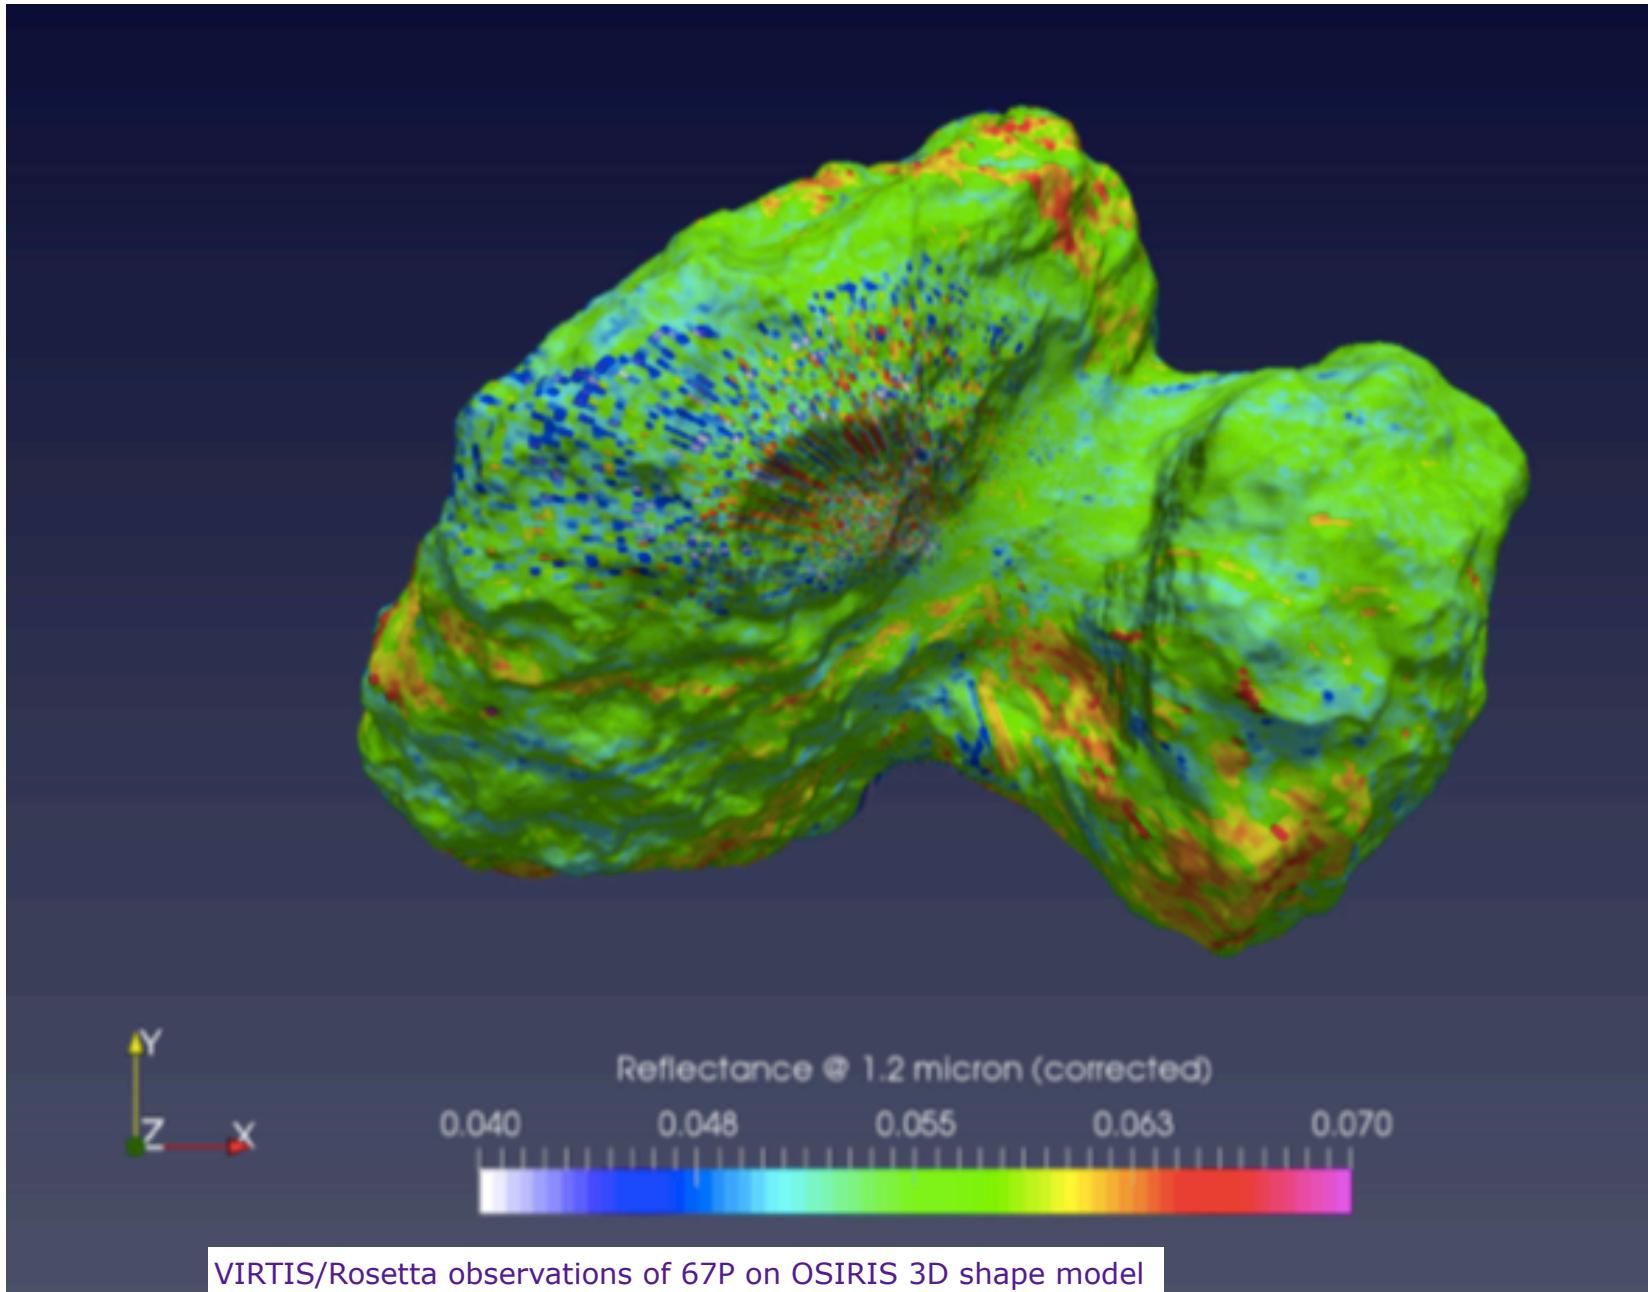

## Support for shape models in TOPCAT

## Updated tools in VESPA

<https://tools.ssdc.asi.it/matisse.jsp>

**MATISSE (ASI):**  
mapping on 3D shape models  
SAMP connection added

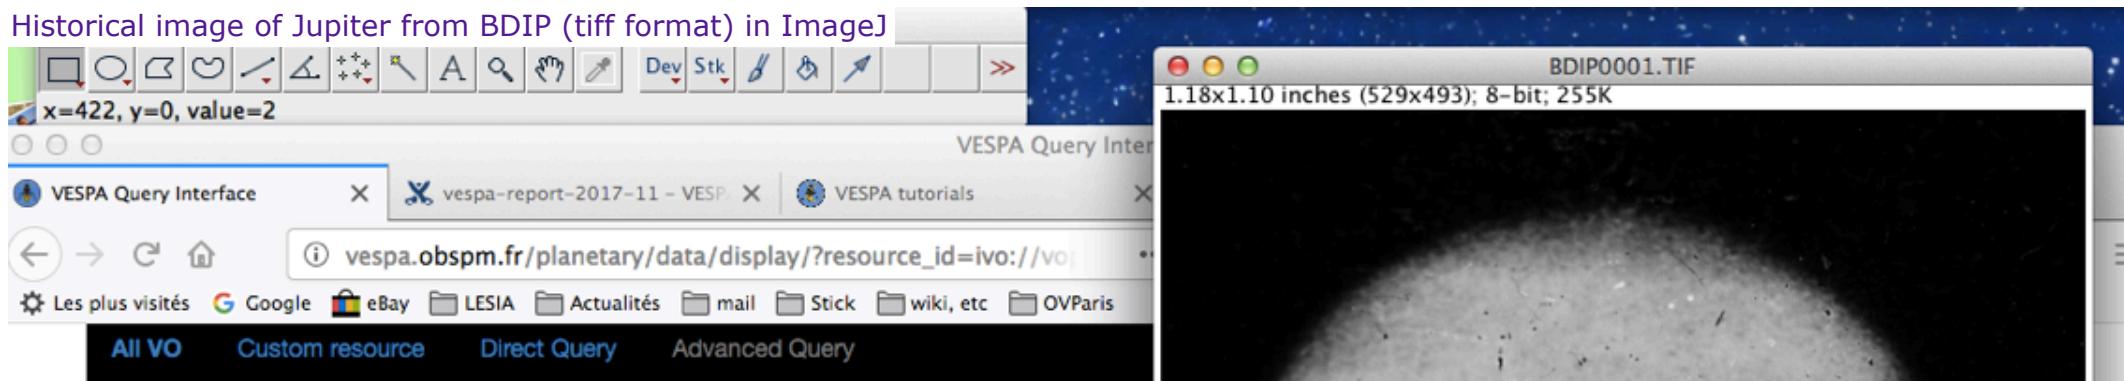

## New tools in VESPA

### ImageJ (open source):

- SAMP connection installed (input only)
- Provides support for unusual data types (TIFF...)
- & format conversion
- Provides image processing functions in the VO

Historical image of Jupiter from BDIP (tiff format) in ImageJ

### Results in service BDIP

## Conclusion (surfaces)

- VESPA mature, proposes standard VO-based solutions to handle surface data

*Will be supported in Europlanet-2024 for 4 years*

*Main focus remain data search & visu + further processing*

*Need to add new dedicated functions in VO tools*

- Open issues

*Coord syst need std description and IDs (hopefully common with planetary GIS)*

*Extend both geojson & s\_region standards to support planetary context*

*Refine access to PDS data*

*No standard for spectral cubes - cruelly missing*

*Refine existing VO-GIS bridge, starting with refined fits support in GDAL (TBC)*
