ARTEMIX - Alma RemoTE MIning eXperiment

Philippe Salome,¹ Nodar Kasradze,¹ and Michel Caillat¹

¹LERMA, Observatoire de Paris, France, philippe.salome@obspm.fr

Abstract. Even if not yet in full operation mode, the ALMA observatory has already delivered huge amounts of data. Those data are accessible to download via the ALMA science archive portal from their parent project id. We present here ARTEMIX (Alma RemoTE MIning eXperiment), a development from the Paris Observatory that aims at exploring new tools for metadata and datacube remote visualisation. ARTEMIX does not reprocess the calibrated data. It is thought as a collection of display facilities which aim is to ease the definition of trans-project subsamples. Future developments, like automated subsample selection via higher-level data analysis are possible, but require the access to fully imaged data-cubes that are not provided yet.

ARTEMIX and YAFITS : Remote Viewer Experiments

P. Salomé,¹ M. Caillat,¹ N. Moreau,¹ and Y.-A. Ba¹

¹LERMA, Observatoire de Paris, F-75014 Paris, France;
philippe.salome@obspm.fr

Abstract. ARTEMIX¹ — The access to astronomical data has never been so simple for our community. From a technical side, it is however more and more difficult. The size and the number of the current and future data-sets raise the question of the best way for astronomers to visualise and to analyse archived observations. The increasing speed of network communications and the much powerful computing capacities of dedicated servers as compared to personal machines naturally question the choice of centralised data-center with remote (client-server) tools versus individual and local softwares. The advent of cloud-based services has already taken over for editing (i.e. overleaf, sharelatex²...) or scripting (jupyter-notebooks³). We present here ARTEMIX: an experiment of a service based on the World Wide Web to explore the ALMA scientific data products (cubes in FITS-format): select a data-set, visualize its content and perform some fundamental measurements. We also introduce YAFITS : its standalone and generalised version, running inside Docker⁴. The strength of these tools is to let the user directly manipulate and display on-line the FITS content without any local resource, other than a simple browser (no download, no local software).

ARTEMIX

ALMA REMOTE MINING

EXPERIMENT

EUROPEAN ARC
ALMA Regional Centre || IRAM

Objectifs

- Recherche par produit plutôt que par configuration instrumentale
- Faire des requêtes multi-projets (ie sources connues)
- Avoir une idée rapide du contenu (fichiers fits)

Moyens

- Previews des configurations d'observation ALMA(meta-data)
- Preview des cubes ALMA (science products QA2)

Contexte

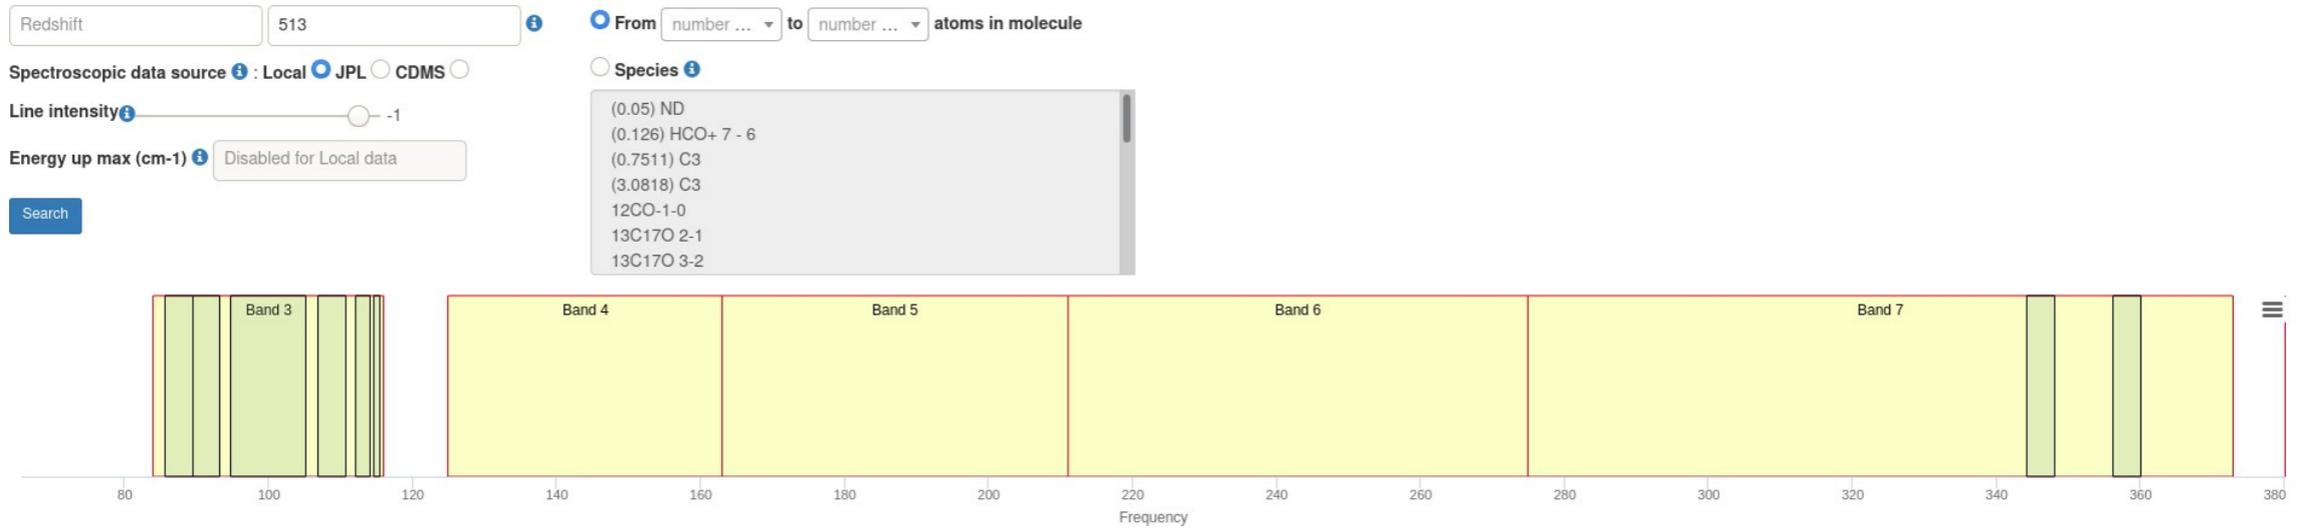

Développé au LERMA à l'Observatoire de Paris, dans le cadre de l'AA-ANO3

Utilisation de cubes de données et de métadonnées publics

N'utilise pas les standards de codage ESO.

Serveur web NodeJS, base de données MongoDB, serveur pour les fichiers FITS bottle (python)

Résultat d'une recherche

Highcharts.com

Warning : the collection of FITS files used by ARTEMIX and copied from the ALMA Science Archive is already quite large. However, it is incomplete; we strive to improve the situation until we have a full copy of the ensemble of FITS files present in the ASA. Please also notice that only a relatively small fraction of all ALMA raw data are actually turned into images. Please go to the [ALMA archive](#) and download raw data for a complete overview of the data.

Récupération des données ALMA

- Téléchargement automatique depuis l'archive publique ALMA
- Toutes ne sont pas récupérées car le volume serait trop important
- Restriction en fonction de la taille des fichiers
- Pour compléter la base de données, nous avons mis en place un service qui récupère les fichiers manquants à la demande de l'utilisateur.
- Service web qui permet :
 - l'affichage de l'ensemble des fichiers sur l'interface web
 - la possibilité de lancer les téléchargements de fichiers dans le système de fichiers d'Artemix
 - la récupération des fichiers fits par l'utilisateur sur sa propre machine

Téléchargement à la demande

Nouveauté 2020 : Accès aux archives ALMA via TAP

- L'ESO a changé son service d'accès aux archives publiques ALMA.
- Les données sont désormais accessibles via le protocole TAP à travers la librairie Astroquery
- Nous y avons recours pour :
 - le téléchargement des fichiers FITS
 - la mise à jour des metadata des fichiers FITS
- Scripts python effectuant requêtes ADQL basées sur le modèle de données ObsCore

ARTEMIX - Alma RemoTE MIning eXperiment

Philippe Salome,¹ Nodar Kasradze,¹ and Michel Caillat¹

¹LERMA, Observatoire de Paris, France, philippe.salome@obspm.fr

Abstract. Even if not yet in full operation mode, the ALMA observatory has already delivered huge amounts of data. Those data are accessible to download via the ALMA science archive portal from their parent project id. We present here ARTEMIX (Alma RemoTE MIning eXperiment), a development from the Paris Observatory that aims at exploring new tools for metadata and datacube remote visualisation. ARTEMIX does not reprocess the calibrated data. It is thought as a collection of display facilities which aim is to ease the definition of trans-project subsamples. Future developments, like automated subsample selection via higher-level data analysis are possible, but require the access to fully imaged data-cubes that are not provided yet.

ARTEMIX and YAFITS : Remote Viewer Experiments

P. Salomé,¹ M. Caillat,¹ N. Moreau,¹ and Y.-A. Ba¹

¹LERMA, Observatoire de Paris, F-75014 Paris, France;
philippe.salome@obspm.fr

Abstract. ARTEMIX¹ — The access to astronomical data has never been so simple for our community. From a technical side, it is however more and more difficult. The size and the number of the current and future data-sets raise the question of the best way for astronomers to visualise and to analyse archived observations. The increasing speed of network communications and the much powerful computing capacities of dedicated servers as compared to personal machines naturally question the choice of centralised data-center with remote (client-server) tools versus individual and local softwares. The advent of cloud-based services has already taken over for editing (i.e. overleaf, sharelatex²...) or scripting (jupyter-notebooks³). We present here ARTEMIX: an experiment of a service based on the World Wide Web to explore the ALMA scientific data products (cubes in FITS-format): select a data-set, visualize its content and perform some fundamental measurements. We also introduce YAFITS : its standalone and generalised version, running inside Docker⁴. The strength of these tools is to let the user directly manipulate and display on-line the FITS content without any local resource, other than a simple browser (no download, no local software).

YAFITS

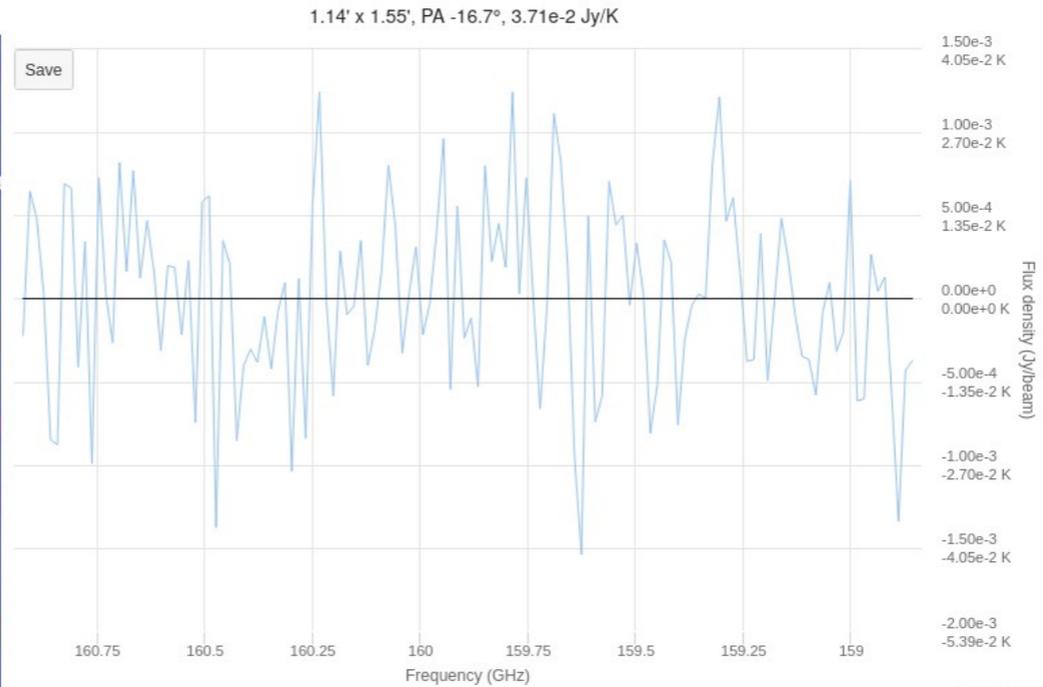

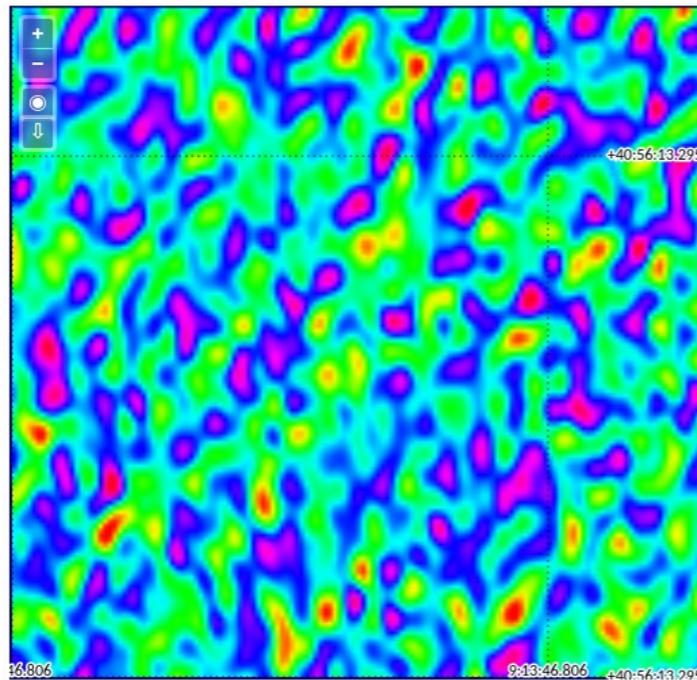

- Outil de visualisation, reprenant l'apparence de Gildas/Go view
- Conteneur Docker – Installation et configuration faciles
- Librairies : Highcharts (spectres) and Openlayers (images)
- Accède au système de fichiers contenant les fichiers FITS
- Destiné aux cubes de données de radio astronomie (tient compte des beam-sizes)
- Testé avec des données MUSE, SITELLE, ALMA, NOEMA
- Collaboration avec l'IRAM pour que Yafits devienne l'outil de visualisation de leur archive

Interface données 2D

Nouvelles fonctionnalités dans Yafits

- Création de fichiers FITS smoothés à partir d'un cube pour augmenter le rapport signal bruit
- Fait mieux ressortir les objets de faible luminosité
- Possibilité de les visualiser et de les télécharger en local, réutilisation dans d'autres applications (GILDAS ...)
- Créations de fichiers FITS téléchargeables à partir des images visualisées, affichage dans l'interface 2D
- Création de fichiers FITS téléchargeables à partir des spectres affichés.

Yafits à l'IRAM

- Discussions en cours depuis quelques mois pour faire de Yafits l'outil de visualisation des cubes de l'IRAM
- Réunions de travail mensuelles
- Test d'installation du conteneur Yafits à l'IRAM l'été dernier
- Quelques adaptations de l'interface pour les besoins IRAM

Perspectives

- Intégration de coordonnées gnomoniques dans la visualisation 2D
- Adaptation de Yafits aux données Nenufar et SKA
- Ajout d'une fonction de cutout dans les cubes de données

Merci !
