The Encyclopedia of Exoplanetary Systems

Global Authority in Exoplanetary Data

 **>7,400 confirmed objects** (<60 Jupiter masses)

 **>30,000 scientific publications** linked to the database

Community Impact

 **25,000+ monthly users** — *researchers, educators, enthusiasts*

 **1,900+ citations** — *in astrophysics journals*

Scope & Accessibility

Includes:

- Confirmed and candidate exoplanets
- Free-floating planetary-mass objects
- Systems with stars, brown dwarfs, and binaries
- Atmospheric data

The Team

Researchers

Q. Kral (PI), F. Roques, J. Schneider — P. Thébault (binary database)

Engineers

P.Y. Martin, U. Chosson, F. Henry

+ Expert science editorial committee — **Transition to an
Expert committee by field**

The Catalogue

Jouvence of the website in 2023-2024

ENCYCLOPAEDIA OF EXOPLANETARY SYSTEMS

This encyclopaedia provides the latest detections and data announced by professional astronomers on exoplanetary systems. It contains objects lighter than 60 masses of Jupiter, which orbit stars or are free-floating. It also provides a database on exoplanets in binary systems, a database on circumstellar disks, an exhaustive bibliography, a list of exoplanet-related meetings, and links to other resources on the subject.

Established in February 1995 Developed and maintained by the [exoplanet TEAM](#)

Last update: March 11, 2025 currently 7419 planets.

The catalog: Filter, sort, export

The plots:  Online plotting tool

RECENT NEWS

Info

MARCH 6, 2025
Over 100 new systems have been added to our [planets-in-binaries](#) database, representing a 30% increase (a machine-readable table of all systems can be found [here](#))

Massive recent update of Exoplanet.eu

Key Updates in 2024

- ✅ Added 1,000+ new objects in 2024
- ✅ 7428 confirmed objects to date — the largest database globally

Comparison with NASA's Archive

📊 **Surpassed NASA's exoplanet count** even when applying their stricter criteria (we have >300 more objects):

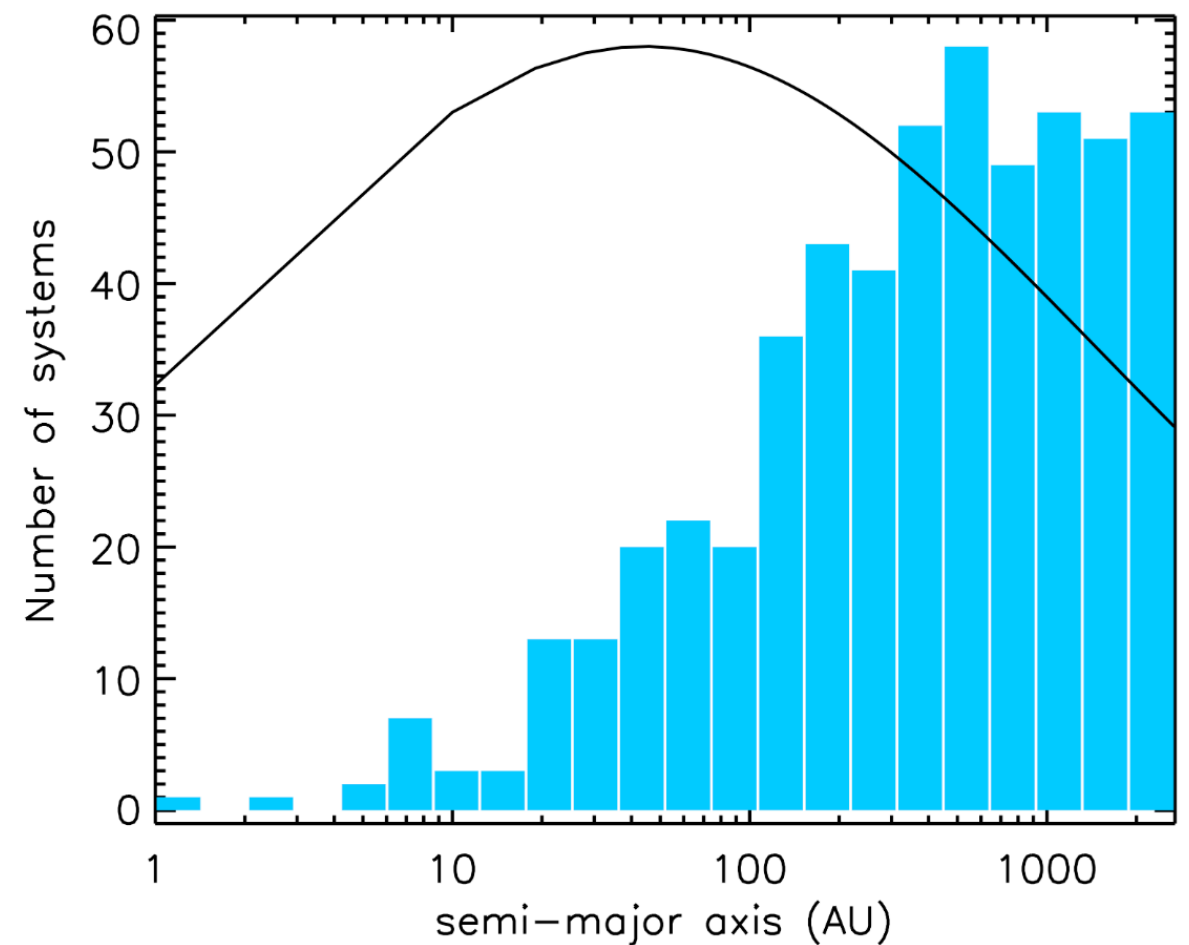

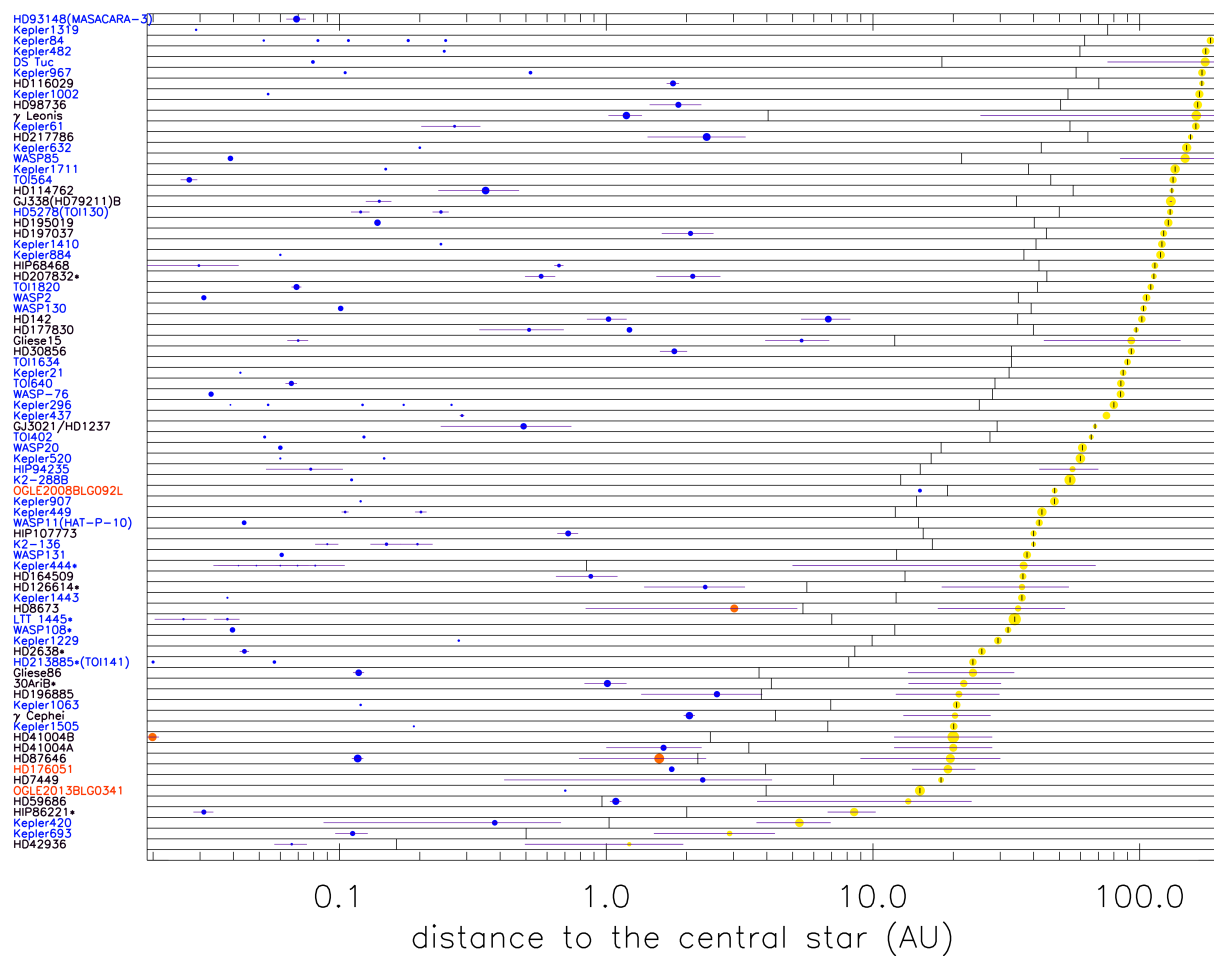

- *No free-floating planetary-mass objects*
- *Mass limit: <30 Jupiter masses*

Major Breakthrough (a few days ago): Binary Systems

- 🌟 **60% increase** in exoplanets listed in binary/multiple-star systems
- 🌟 **545+ binary systems** now cataloged which is unique

The binary database

List all exoplanets on S-type orbits in binaries with separations up to 2000au (currently 545 systems) + 30 P-type (circumbinary)

Vision for the coming years

TWO main goals being tackled at the moment

1) From an exoplanet database to that of a planetary system

- Account for disks, exomoons, exocomets...
- Include some observation data?

2) Coping with massive increase of number of planets by 2030

Fig. 1. Extrapolation of the exoplanet count into the year 2050. The black solid line is a fit to the data from 1988 to 2018, which hits a value of almost 100,000,000 in 2050. The dashed lines are the envelopes of the data. Red numbers along the abscissa and ordinate denote the ranges of extrapolation, for which no data is yet available. The vertical bar above the year 2030 refers to a combination of the currently known exoplanet population and expected exoplanet yields for Gaia, TESS, and PLATO as presented in the literature. The data points were taken from [National Academies of Sciences & Medicine \(2018\)](#) based on data by A. Weinberger/NASA Exoplanet Archive. Adapted and reproduced with permission from the National Academy of Sciences, Courtesy of the National Academies Press, Washington, D.C.

- 2030: ~100,000 planets (>10x growth)
- 2040: 1,000,000+ planets (if trends hold)

First Goal: From an exoplanet database to that of a planetary system

The Challenge

Complexity of Planetary Systems:

- Interactions between disks, planets, exomoons, and binary stars
- Diverse objects: exoplanets, brown dwarfs, exocomets, disks, multiple stars

Data Overload makes visual representation complex:

- Many parameters and complex relationships
- Risk of user confusion with inconsistent data representation

The Solution: EXODAM

A new Data Model for Exoplanetary Systems

- **Dynamic Frame:** Adapts to new objects/parameters *on the fly* (e.g., exomoons, disks)
- **Unified Hierarchy:** Organizes all system components (stars, planets, disks) into interconnected layers
- **Scalable:** Zero technical maintenance required for adding new parameters
- **Universal:** Could be used more globally for VO purposes

An example of an EXODAM data model JSON file

Publications: Could provide new planets (or disks...) using this data model —> the planets would be integrated in no time.

More flexibility: New parameters can be added at will without breaking the database —> can include parameters that were not measured before or add info on disks, exomoons, exocomets, observational data, ...

In development: Ingestion of large lists of exoplanets from csv files using EXODAM

Scaling for the Exoplanet Data Tsunami (2030+)

Second goal: Cope with massive increase of number of planets by 2030+

The Challenge

⚠ Manual Data Entry:

- Current: ~7,400 planets (hand-curated)
- 2030: ~100,000 planets (>10x growth)
- 2040: 1,000,000+ planets (if trends hold)

Unsustainable Workflow:

- Daily manual updates → *impossible at scale*
- Risk of errors, delays, and incomplete data

Status: ☒ active ☐ hidden ☐ imported ☐ suggested

Whether the object is visible on the website or not

Physical parameters (Hide)

Parameters of the planet.
Specify parameter uncertainty in a form of an array, e.g. '[0.1,0.2]' for a value_0.1^{+0.2} or simply '[0.1]' for values 0.1. Use nan and inf for special cases of upper/lower limits and undefined value.

Planetary Radius: 2.23

Planetary Radius error: [0.09,0.15]

Unit: Rearth ▼

Scaling for the Exoplanet Data Tsunami (2030+)

Second goal: Cope with massive increase of number of planets by 2030+

The Solution: Automate & Democratize

EXODAM as the Universal Standard:

- **Machine-Readable Data:** Pre-formatted templates for users to submit their list of new data
- **Community-Driven Uploads:**
 - *Dropbox portal* for users to submit data + publications
 - Automated validation + human cross-check

Bulk Ingestion:

- Pre-negotiate pipelines with missions (e.g., **PLATO's**)
- AI-assisted research, tagging, or relationship mapping?

The Road Ahead: Scaling exoplanet.eu

Great Showcase for OBSPM but Challenges on the way

⚠ Team Capacity:

- **3-person team** → *2 retired (emeritus)*
- **Urgent need:** Hire engineers + scientists to manage growth

📈 Data Deluge:

- **100,000+ exoplanets expected by 2030** (Manual processes → *unsustainable*)
- *All exoplanetary components to ingest (e.g. disks, exocomets, ...)*

Immediate Priorities

🚀 Deploy & Stabilize:

- Finish and deploy tools (ExoREM, Exo3D, ExoDisk)
- Finalize integration of **EXODAM data model** in backend
- Launch **community upload portal** (dropbox, API, csv ingestion)

💡 Leverage Community:

- Crowdsourcing ideas (e.g., **RV/transit data integrations**)
- Gather experts on each subfields to secure sets of data

Call to Action

🔧 We Need:

- **Engineers:** Backend scaling (EXODAM), AI/automation, Frontend development (Tools)
- **Scientists:** Data ingestion/validation, Tool developments for users

🌍 Join Us:
